## Notices and Disclaimers

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

Project:	All					
Format:	GeneralStateOffset[31:0]					

## A64 Data Size Message Descriptor Control Field

### MDC\_A64\_DS - A64 Data Size Message Descriptor Control Field

Project: CHV, BSW  
 Source: PRM  
 Size (in bits): 2  
 Default Value: 0x00000000

DWord	Bit	Description		
0	1:0	<b>Data Size</b>		
		Project:	All	
		Format:	Enumeration	
		Specifies the number of data elements to be read or written		
Value	Name	Description	Project	
00h	DE1	1 data element (B, DW, QW)	All	
01h	DE2	2 data elements (B, DW, QW)	All	
02h	DE4	4 data elements (B, DW, QW)	All	
03h	DE8	8 data elements (B, DW, QW)	All	
<b>Restriction</b>				
The number of elements is constrained by SIMD Mode and Data Width. The max data payload limit is 256B: 2 elements SIMD16 QW, 4 elements SIMD16 DW, or 4 elements SIMD8 QW.				

## A64 Dual Oword Block Message Header

## A64 Oword Dual Data Blocks Message Descriptor Control Field

<b>MDC_A64_DB_OWD - A64 Oword Dual Data Blocks Message Descriptor Control Field</b>				
Project: CHV, BSW Source: PRM Size (in bits): 3 Default Value: 0x00000001				
<b>DWord</b>	<b>Bit</b>	<b>Description</b>		
0	2:0	<b>Data Blocks</b>		
		Project:	All	
		Format:	Enumeration	
		Specifies the number of Oword blocks to be read or written		
Value	Name	Description	Project	
01h	OWD1 <b>[Default]</b>	1 Hword register, 2 Owords	All	
03h	OWD4	4 Hword registers, 8 Owords	All	
Others	Reserved	Ignored	All	

## AddrSubRegNum

<b>AddrSubRegNum</b>									
Project: CHV, BSW Source: Eulsa Size (in bits): 4 Default Value: 0x00000000									
Address Subregister Number This field provides the subregister number for the address register. The address register contains 8 sub-registers. The size of each subregister is one word. The address register contains the register address of the operand, when the operand is in register-indirect addressing mode. This field applies to the destination operand and the source operands. It is ignored (or not present in the instruction word) for an immediate source operand. This field is present if the operand is in register-indirect addressing mode; it is not present if the operand is directly addressed. An address subregister used for indirect addressing is often called an index register.									
DWord	Bit	Description							
0	3:0	<b>Address Subregister Number</b> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 2px;">Project:</td><td style="padding: 2px;">CHV, BSW</td></tr> <tr> <th style="background-color: #e0e0ff; text-align: center; padding: 2px;">Value</th><th style="background-color: #e0e0ff; text-align: center; padding: 2px;">Name</th></tr> <tr> <td style="padding: 2px;">0-15</td><td style="padding: 2px;">Address Subregister Number</td></tr> </table>		Project:	CHV, BSW	Value	Name	0-15	Address Subregister Number
Project:	CHV, BSW								
Value	Name								
0-15	Address Subregister Number								

## Any Binding Table Index Message Descriptor Control Field

### MDC\_BTS\_SLM\_A32 - Any Binding Table Index Message Descriptor Control Field

Project: CHV, BSW

Source: PRM

Size (in bits): 8

Default Value: 0x00000000

DWord	Bit	Description				
0	7:0	<b>Binding Table Index</b>				
		Project:	All			
		Format:	Enumeration			
Specifies the surface for the message, which can be Surface State Model, SLM or Stateless.						
Value	Name	Description		Project		
00h-0EFh	BTS	Index of Binding Table State Surfaces		All		
F0h-OFBh	Reserved	Reserved for future use		All		
0FCh	Reserved	Reserved for future use		CHV, BSW		
0FEh	SLM	Specifies an SLM access		All		
OFFh	A32_A64	Specifies a A32 or A64 Stateless access that is locally coherent (coherent within a thread group)		All		
0FDh	A32_A64_NC	Specifies a A32 or A64 Stateless access that is non-coherent (coherent within a thread).		All		
Restriction						
When using A32_A64_NC, SW must ensure that 2 threads do not both access the same cache line (64B)						

## Atomic Integer Binary Operation Message Descriptor Control Field

### MDC\_AOP2 - Atomic Integer Binary Operation Message Descriptor Control Field

Project: CHV, BSW  
Source: PRM  
Size (in bits): 4  
Default Value: 0x00000001

DWord	Bit	Description		
0	3:0	<b>Atomic Integer Operation Type</b>		
		Project:	All	
		Format:	Enumeration	
Specifies the atomic integer binary operation to be performed				
Value	Name	Description	Project	
01h	AOP_AND <b>[Default]</b>	new_dst = old_dst AND src0	All	
02h	AOP_OR	new_dst = old_dst   src0	All	
03h	AOP_XOR	new_dst = old_dst ^ src0	All	
04h	AOP_MOV	new_dst = src0	All	
07h	AOP_ADD	new_dst = old_dst + src0	All	
08h	AOP_SUB	new_dst = old_dst - src0	All	
09h	AOP_REVSUB	new_dst = src0 - old_dst	All	
0Ah	AOP_IMAX	new_dst = imax(old_dst, src0)	All	
0Bh	AOP_IMIN	new_dst = imin(old_dst, src0)	All	
0Ch	AOP_UMAX	new_dst = umax(old_dst, src0)	All	
0Dh	AOP_UMIN	new_dst = umin(old_dst, src0)	All	
Others	Reserved	Ignored	All	
<b>Programming Notes</b>				
When Return Data Control is set, old_dst is returned.				

## Atomic Integer Trinary Operation Message Descriptor Control Field

<b>MDC_AOP3 - Atomic Integer Trinary Operation Message Descriptor Control Field</b>			
DWord	Bit	Description	
0	3:0	<b>Atomic Integer Operation Type</b>	
		Project:	All
		Format:	Enumeration
		Specifies the atomic integer trinary operation to be performed	
Value	Name	Description	Project
00h	AOP_CMPWR_2W	new_dst = (src0_2W == old_dst_2W) ? src1_2W : old_dst_2W	All
0Eh	AOP_CMPWR [Default]	new_dst = (src0 == old_dst) ? src1 : old_dst	All
Others	Reserved	Ignored	All
<b>Programming Notes</b>			
When Return Data Control is set, old_dst is returned.			

## Atomic Integer Unary Operation Message Descriptor Control Field

MDC_AOP1 - Atomic Integer Unary Operation Message Descriptor Control Field			
DWord	Bit	Description	
0	3:0	<b>Atomic Integer Operation Type</b>	
		Project:	All
		Format:	Enumeration
		Specifies the atomic integer unary operation to be performed	
Value	Name	Description	Project
05h	AOP_INC [Default]	new_dst = old_dst + 1	All
06h	AOP_DEC	new_dst = old_dst - 1	All
0Fh	AOP_PREDEC	new_dst = old_dst - 1	All
Others	Reserved	Ignored	All
<b>Programming Notes</b>			
When Return Data Control is set, new_dst is returned by AOP_PREDEC and otherwise old_dst is returned.			

## AVC CABAC

AVC CABAC		
DWord	Bit	Description
0	15	<b>Reserved</b> Format: MBZ
	14	<b>Coefficient level out-of-bound Error</b> This flag indicates the coded coefficient level SEs in the bit-stream is out-of-bound.
	13	<b>Reserved</b> Format: MBZ
	12	<b>Reserved</b> Format: MBZ
	11	<b>Temporal Direction Motion Vector Out-of-Bound Error</b> This flag indicates motion vectors calculated from Temporal Direct Motion Vector is larger than the allowed range specified by the AVC spec.
	10	<b>Reserved</b> MBZ
	9	<b>Motion Vector Delta SE Out-of-Bound Error</b> This flag indicates inconsistent Motion Vector Delta SEs coded in the bit-stream.
	8	<b>Reference Index SE Out-of-Bound Error</b> This flag indicates inconsistent Reference Index SEs coded in the bit-stream.
	7	<b>MacroBlock QpDelta Error</b> This flag indicates out-of-bound MB QP delta SEs coded in the bit-stream.
	6	<b>Motion Vector Delta SE Error</b> This flag indicates out-of-bound motion vector delta SEs coded in the bit-stream.
	5	<b>Reference Index SE Error</b> This flag indicates out-of-bound Refidx SEs coded in the bit-stream.
	4	<b>Residual Error</b> This flag indicates out-of-bound absolute coefficient level SEs coded in the bit-stream.
	3	<b>Slice end Error</b> This flag indicates a pre-matured slice_end SE or inconsistent slice end on the last MB of a slice.
	2	<b>Chroma Intra prediction Mode Error</b> This flag indicates inconsistent Chroma Intra prediction mode SEs coded in the bit-stream.
	1	<b>Luma Intra prediction Mode Error</b> This flag indicates inconsistent luma Intra prediction mode SE coded in the bit-stream.

## AVC CABAC

	0	<b>MB Concealment Flag</b> Each pulse from this flag indicates one MB is concealed by hardware.
--	---	--

**MB Concealment Flag**

Each pulse from this flag indicates one MB is concealed by hardware.

## AVC CAVLC

AVC CAVLC		
DWord	Bit	Description
0	15	<b>Total Zero out-of-bound Error</b> This flag indicates the Total zero SE count exceed the max number of coeffs allowed in an intra16x16 AC block.
	14	<b>Coefficient level out-of-bound Error</b> This flag indicates the coded coefficient level SEs in the bit-stream is out-of-bound.
	13	<b>RunBefore out-of-bound Error</b> This flag indicates the coded RunBefore SE value is larger than the remaining zero block count.
	12	<b>Total coefficient Out-of-bound Error</b> This flag indicates the coded total coeff SE count exceed the max number of coeffs allowed in an intra16x16 AC block.
	11	<b>Temporal Direction Motion Vector Out-of-Bound Error</b> This flag indicates motion vectors calculated from Temporal Direct Motion Vector is larger than the allowed range specified by the AVC spec.
	10	<b>Reserved</b> Reserved
	9	<b>Motion Vector Delta SE Out-of-Bound Error</b> This flag indicates inconsistent Motion Vector Delta SEs coded in the bit-stream.
	8	<b>Reference Index SE Out-of-Bound Error</b> This flag indicates inconsistent Reference Index SEs coded in the bit-stream.
	7	<b>RunBefore/TotalZero Error</b> This flag indicates one or more inconsistent RunBefore or TotalZero SEs coded in the bit-stream.
	6	<b>Exponential Golomb Error</b> This flag indicates hardware detects more than 18 leadzero for skip and more than 19 for other SEs from the Exponential Golomb Logic
	5	<b>Total Coeff SE Error</b> This flag indicates one or more inconsistent total coeff SEs coded in the bit-stream.
	4	<b>Macroblock Coded Block Pattern Error</b> This flag indicates inconsistent CBP SEs coded in the bit-stream.
	3	<b>Mbytype/submbtype Error</b> This flag indicates inconsistent MBtype/SubMBtype SEs coded in the bit-stream.
	2	<b>Chroma Intra prediction Mode Error</b> This flag indicates inconsistent Chroma Intra prediction mode SEs coded in the bit-stream.
	1	<b>Luma Intra prediction Mode Error</b>

## AVC CAVLC

		This flag indicates inconsistent luma Intra prediction mode SE coded in the bit-stream.
0	<b>MB Concealment Flag</b>	Each pulse from this flag indicates one MB is concealed by hardware.

Project:	All							
Description	Project							
This interrupt is for handling Legacy Page Fault interface for all Command Streamers (BCS, RCS, VCS, VECS). When Fault Repair Mode is enabled, Interrupt mask register value is not looked at to generate interrupt due to page fault. Please refer to vol1c	CHV, BSW							

## Bit Definition for Interrupt Control Registers - Render

	"Page Fault Support" section for more details.	
6	<b>Timeout Counter Expired</b> Set when the render pipe timeout counter (0x02190) has reached the timeout threshold value (0x0217c).	
5	<b>L3 Parity Error (Slice0)</b>  Project: CHV, BSW  When this bit is set, L3 cache controller is indicating that it has encountered an parity error while checking the data.	
4	<b>PIPE_CONTROL Notify Interrupt</b> The Pipe Control packet (Fences) specified in 3D pipeline document may optionally generate an Interrupt. The Store QW associated with a fence is completed ahead of the interrupt.	
3	<b>Render Command Parser Master Error</b> When this status bit is set, it indicates that the hardware has detected an error. It is set by the device upon an error condition and cleared by a CPU write of a one to the appropriate bit contained in the Error ID register followed by a write of a one to this bit in the IIR. Further information on the source of the error comes from the "Error Status Register" which along with the "Error Mask Register" determine which error conditions will cause the error status bit to be set and the interrupt to occur. <b>Page Table Error:</b> Indicates a page table error. <b>Instruction Parser Error:</b> The Render Instruction Parser encounters an error while parsing an instruction.	
2	<b>Reserved</b>  Project: CHV, BSW  Format: MBZ	
1	<b>Reserved</b>	
0	<b>Render Command Parser User Interrupt</b> This status bit is set when an MI_USER_INTERRUPT instruction is executed on the Render Command Parser. Note that instruction execution is not halted and proceeds normally. A mechanism such as an MI_STORE_DATA instruction is required to associate a particular meaning to a user interrupt.

## BR00 - BLT Opcode and Control

BR00 - BLT Opcode and Control										
DWord	Bit	Description								
0	31	<b>BLT Engine Busy</b> This bit indicates whether the BLT Engine is busy (1) or idle (0). This bit is replicated in the SETUP BLT Opcode and Control register. <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Idle <b>[Default]</b></td> </tr> <tr> <td>1</td> <td>Busy</td> </tr> </tbody> </table>	Value	Name	0	Idle <b>[Default]</b>	1	Busy		
Value	Name									
0	Idle <b>[Default]</b>									
1	Busy									
	30	<b>Setup Instruction Instruction</b> Default Value: 0 The current instruction performs clipping (1).								
	29	<b>Setup Monochrome Pattern</b> This bit is decoded from the Setup instruction opcode to identify whether a color (0) or monochrome (1) pattern is used with the SCANLINE_BLT instruction. <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Color <b>[Default]</b></td> </tr> <tr> <td>1</td> <td>Monochrome</td> </tr> </tbody> </table>	Value	Name	0	Color <b>[Default]</b>	1	Monochrome		
Value	Name									
0	Color <b>[Default]</b>									
1	Monochrome									
	28:22	<b>Instruction Target (Opcode)</b> Default Value: 0000000b This is the contents of the Instruction Target field from the last BLT instruction. This field is used by the BLT Engine state machine to identify the BLT instruction it is to perform. The opcode specifies whether the source and pattern operands are color or monochrome.								
	21:20	<b>32bpp Byte Mask</b> This field is only used for 32bpp. <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> </tr> </thead> <tbody> <tr> <td>00b</td> <td><b>[Default]</b></td> </tr> <tr> <td>1xb</td> <td>Write Alpha Channel</td> </tr> <tr> <td>x1b</td> <td>Write RGB Channel</td> </tr> </tbody> </table>	Value	Name	00b	<b>[Default]</b>	1xb	Write Alpha Channel	x1b	Write RGB Channel
Value	Name									
00b	<b>[Default]</b>									
1xb	Write Alpha Channel									
x1b	Write RGB Channel									
	19:17	<b>Monochrome Source Start</b> Default Value: 000b This field indicates the starting monochrome pixel bit position within a byte per scan line of the								

## BR00 - BLT Opcode and Control

		source operand. The monochrome source is word aligned which means that at the end of the scan line all bits should be discarded until the next word boundary.												
16	<b>Bit/Byte Packed</b> Byte packed is for the NT driver.	<table border="1" style="width: 100%;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0b</td> <td>Bit [Default]</td> </tr> <tr> <td style="text-align: center;">1b</td> <td>Byte</td> </tr> </tbody> </table>	Value	Name	0b	Bit [Default]	1b	Byte

15:0	<b>Destination Pitch (Offset)</b>	<p>For non-XY Blits, the signed 16bit field allows for specifying upto + 32Kbytes signed pitches in bytes (same as before). For X, Y Blits with tiled-X surfaces, the pitch for Destination will be 512Byte aligned and should be programmable upto + 128Kbytes. For X, Y Blits with tiled-Y surfaces, the pitch for Destination will be 128Byte aligned and should be programmable upto +</p>										

**BR01 - Setup BLT Raster OP, Control, and Destination Offset**

	128Kbytes. In this case, this 16bit signed pitch field is used to specify upto + 32KDWords. For X, Y blits with nontiled surfaces (linear surfaces), this 16bit field can be programmed to byte specification of upto + 32Kbytes (same as before). These 16 bits store the signed memory address offset value by which the destination address originally specified in the Destination Address Register is incremented or decremented as each scan line's worth of destination data is written into the frame buffer by the BLT Engine, so that the destination address will point to the next memory address to which the next scan line's worth of destination data is to be written. If the intended destination of a BLT operation is within on-screen frame buffer memory, this offset is normally set so that each subsequent scan line's worth of destination data lines up vertically with the destination data in the scan line, above. However, if the intended destination of a BLT operation is within off-screen memory, this offset can be set so that each subsequent scan line's worth of destination data is stored at a location immediately after the location where the destination data for the last scan line ended, in order to create a single contiguous block of bytes of destination data at the destination.
--	--

## BR05 - Setup Expansion Background Color

BR05 - Setup Expansion Background Color		
DWord	Bit	Description
0	31:0	<p><b>Setup Expansion Background Color Bits</b></p> <p>These bits provide the one, two, or four bytes worth of color data that select the background color to be used in the color expansion of monochrome pattern or source data for either the SCANLINE_BLT or TEXT_BLT instructions. BR05 is also used as the solid pattern for the PIXEL_BLT instruction. Whether one, two, or three bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.</p>

## BR06 - Setup Expansion Foreground Color

BR06 - Setup Expansion Foreground Color		
DWord	Bit	Description
0	31:0	<p><b>Setup Expansion Foreground Color Bits</b></p> <p>These bits provide the one, two, or four bytes worth of color data that select the foreground color to be used in the color expansion of monochrome pattern or source data for either the SCANLINE_BLT or TEXT_BLT instructions. Whether one, two, or three bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.</p>

## BR07 - Setup Blit Color Pattern Address Lower Order Address bits

<b>BR07 - Setup Blit Color Pattern Address Lower Order Address bits</b>				
<b>DWord</b>	<b>Bit</b>	<b>Description</b>		
0	31:6	<p><b>Setup Blit Color Pattern Address</b></p> <table border="1"> <tr> <td>Format:</td> <td>GraphicsAddress[31:6]</td> </tr> </table> <p>Lower 32bits of the 48bit addressing.</p> <p>These 26 bits specify the starting address of the (8X8) pixel color <b>pattern from the SETUP_BLT instruction</b>. This register works identically to the Pattern Address register (BR15), but this version is <b>only used with the SCANLINE_BLT instruction execution</b> (the actual programming for this, is done in XY_SETUP_BLT command). The pattern data must be located in linear memory.</p> <p>The pattern data must be located on a pattern-size boundary. The pattern is always of 8x8 pixels, and therefore, its size is dependent upon its pixel depth. The pixel depth may be 8, 16, or 32 bits per pixel if the pattern is in color (the pixel depth of a color pattern must match the pixel depth to which the graphics system has been set). Monochrome patterns require 8 bytes and is supplied through the instruction. Color patterns of 8, 16, and 32 bits per pixel color depth must start on 64-byte, 128-byte and 256-byte boundaries, respectively.</p> <p>The Pattern Base Address programmed, must always be Cache Line (64byte) aligned.</p>	Format:	GraphicsAddress[31:6]
Format:	GraphicsAddress[31:6]			
	5:0	<p><b>Reserved</b></p> <table border="1"> <tr> <td>Format:</td> <td>MBZ</td> </tr> </table>	Format:	MBZ
Format:	MBZ			

## BR09 - Destination Address Lower Order Address Bits

BR09 - Destination Address Lower Order Address Bits				
DWord	Bit	Description		
0	31:0	<p><b>Destination Address Bits</b></p> <table border="1"> <tr> <td>Format:</td> <td>GraphicsAddress[31:0]</td> </tr> </table> <p>When tiling is enabled for XY-blits, this base address should be limited to 4KB. when tiling is disabled for XY-blits, this base address should be CL (64byte) aligned. These lower 32bits of the 48bit address, which specify the starting pixel address of the destination data. This register is also the working destination address register for the lower 32bits of the address, and changes as the BLT Engine performs the accesses. Used as the scan line address (Destination Y Address and Destination Y1 Address) for BLT instructions: PIXEL_BLT, SCANLINE_BLT, and TEXT_BLT. In this case the address points to the first pixel in a scan line and is compared with the ClipRect Y1 and Y2 address registers to determine whether the scan line should be written or not. The Destination Y1 address is the top scan line to be written for text. Note that for non-XY blits (COLOR_BLT, SRC_COPY_BLT), this address points to the first byte to be written. Note: Some instructions affect only one scan line (requiring only one coordinate); other instructions affect multiple scan lines and need both coordinates.</p>	Format:	GraphicsAddress[31:0]
Format:	GraphicsAddress[31:0]			

## BR11 - BLT Source Pitch (Offset)

BR11 - BLT Source Pitch (Offset)		
DWord	Bit	Description
0	31:16	<b>Reserved</b>
	15:0	<p><b>Source Pitch (Offset)</b></p> <p>For non-XY Blits with color source operand (SRC_COPY_BLT), the signed 16bit field allows for specifying upto + 32Kbytes signed pitch in bytes (same as before). For X, Y Blits with tiled-X surfaces, the pitch for Color Source will be 512Byte aligned and should be programmable upto + 128Kbytes. For X, Y Blits with tiled-Y surfaces, the pitch for Color Source will be 128Byte aligned and should be programmable upto + 128Kbytes. In this case, this 16bit signed pitch field is used to specify upto + 32KDWords. For X, Y blits with nontiled color source surfaces (linear surfaces), this 16bit field can be programmed to byte specification of upto + 32Kbytes (same as before). When the color source data is located within the frame buffer or AGP aperture, these signed 16 bits store the memory address offset (pitch) value by which the source address originally specified in the Source Address Register is incremented or decremented as each scan line's worth of source data is read from the frame buffer by the BLT Engine, so that the source address will point to the next memory address from which the next scan line's worth of source data is to be read. Note that if the intended source of a BLT operation is within on-screen frame buffer memory, this offset is normally set to accommodate the fact that each subsequent scan line's worth of source data lines up vertically with the source data in the scan line, above. However, if the intended source of a BLT operation is within off-screen memory, this offset can be set to accommodate a situation in which the source data exists as a single contiguous block of bytes where in each subsequent scan line's worth of source data is stored at a location immediately after the location where the source data for the last scan line ended.</p>

## BR12 - Source Address Lower order Address bits

BR12 - Source Address Lower order Address bits				
DWord	Bit	Description		
0	31:0	<p><b>Source Address Bits</b></p> <table border="1"> <tr> <td>Format:</td> <td>GraphicsAddress[31:0]</td> </tr> </table> <p>Lower 32bits of the 48bit addressing.  When tiling is enabled for XY-blits with Color source surfaces, this base address should be limited to 4KB. When tiling is disabled for XY-blits, this base address should be CL (64byte) aligned.  Note that for non-XY blit with Color Source (SRC_COPY_BLT), this address points to the first byte to be read.  These lower 32bits of the 48bit address, specify the starting pixel address of the color source data.  The lower 3 bits are used to indicate the position of the first valid byte within the first Quadword of the source data.  If this Source happens to be a Monosource surface, then this Monosource Base Address programmed, must always be Cache Line (64byte) aligned.</p>	Format:	GraphicsAddress[31:0]
Format:	GraphicsAddress[31:0]			

## BR13 - BLT Raster OP, Control, and Destination Pitch

BR13 - BLT Raster OP, Control, and Destination Pitch											
DWord	Bit	Description									
0	31	<p><b>Solid Pattern Select</b></p> <p>This bit applies only when the pattern data is monochrome. This bit determines whether or not the BLT Engine actually performs read operations from the frame buffer in order to load the pattern data. Use of this feature to prevent these read operations can increase BLT Engine performance, if use of the pattern data is indeed not necessary. The BLT Engine is configured to accept either monochrome or color pattern data via the opcode field.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>[Default]</td> <td>This causes normal operation with regard to the use of the pattern data. The BLT Engine proceeds with the process of reading the pattern data, and the pattern data is used as the pattern operand for all bit-wise operations.</td> </tr> <tr> <td>1</td> <td></td> <td>The BLT Engine forgoes the process of reading the pattern data, the presumption is made that all of the bits of the pattern data are set to 0, and the pattern operand for all bit-wise operations is forced to the background color specified in the Color Expansion Background Color Register.</td> </tr> </tbody> </table>	Value	Name	Description	0	[Default]	This causes normal operation with regard to the use of the pattern data. The BLT Engine proceeds with the process of reading the pattern data, and the pattern data is used as the pattern operand for all bit-wise operations.	1		The BLT Engine forgoes the process of reading the pattern data, the presumption is made that all of the bits of the pattern data are set to 0, and the pattern operand for all bit-wise operations is forced to the background color specified in the Color Expansion Background Color Register.
Value	Name	Description									
0	[Default]	This causes normal operation with regard to the use of the pattern data. The BLT Engine proceeds with the process of reading the pattern data, and the pattern data is used as the pattern operand for all bit-wise operations.									
1		The BLT Engine forgoes the process of reading the pattern data, the presumption is made that all of the bits of the pattern data are set to 0, and the pattern operand for all bit-wise operations is forced to the background color specified in the Color Expansion Background Color Register.									
30	<p><b>Clipping Enabled</b></p> <table border="1"> <tr> <td>Default Value:</td> <td>0</td> </tr> </table>	Default Value:	0

23:16	<b>Raster Operation Select</b>	<p>Default Value: <input type="text" value="00000000b"/></p> <p>These 8 bits are used to select which one of 256 possible raster operations is to be performed by the BLT Engine.</p>										
15:0	<b>Destination Pitch(Offset)</b>	<p>These 16 bits store the signed memory address offset value by which the destination address originally specified in the Destination Address Register is incremented or decremented as each scan line's worth of destination data is written into the frame buffer by the BLT Engine, so that the destination address will point to the next memory address to which the next scan line's worth of destination data is to be written. If the intended destination of a BLT operation is within on-screen frame buffer memory, this offset is normally set so that each subsequent scan line's worth of destination data lines up vertically with the destination data in the scan line, above. However, if the intended destination of a BLT operation is within off-screen memory, this offset can be set</p>										

**BR13 - BLT Raster OP, Control, and Destination Pitch**

		so that each subsequent scan line's worth of destination data is stored at a location immediately after the location where the destination data for the last scan line ended, in order to create a single contiguous block of bytes of destination data at the destination.
--	--	---

## BR14 - Destination Width and Height

BR14 - Destination Width and Height		
DWord	Bit	Description
0	31:29	<b>Reserved</b>
	28:16	<b>Destination Height</b> These 13 bits specify the height of the destination data in terms of the number of scan lines. This is a working register.
	15:13	<b>Reserved</b>
	12:0	<b>Destination Byte Width</b> These 13 bits specify the width of the destination data in terms of the number of bytes per scan line. The number of pixels per scan line into which this value translates depends upon the color depth to which the graphics system has been set.

## BR15 - Color Pattern Address Lower order Address bits

BR15 - Color Pattern Address Lower order Address bits				
DWord	Bit	Description		
0	31:6	<p><b>Color Pattern Address</b></p> <table border="1"> <tr> <td>Format:</td> <td>GraphicsAddress[31:6]</td> </tr> </table> <p>Lower 32bits of the 48bit addressing.</p> <p>There is no change to the Color Pattern address specification due to Non-Power-of-2 change. It remains the same as before. The pattern data must be located in linear memory.</p> <p>These 26 bits specify the starting address of the (8X8) pixel color pattern.</p> <p>The pattern data must be located on a pattern-size boundary. The pattern is always of 8x8 pixels, and therefore, its size is dependent upon its pixel depth. The pixel depth may be 8, 16, or 32 bits per pixel if the pattern is in color (the pixel depth of a color pattern must match the pixel depth to which the graphics system has been set). Monochrome patterns require 8 bytes and are applied through the instruction. Color patterns of 8, 16, and 32 bits per pixel color depth must start on 64-byte, 128-byte and 256-byte boundaries, respectively.</p> <p>The Pattern Base Address programmed, must always be Cache Line (64byte) aligned.</p>	Format:	GraphicsAddress[31:6]
Format:	GraphicsAddress[31:6]			
5:0	<p><b>Reserved</b></p> <table border="1"> <tr> <td>Format:</td> <td>MBZ</td> </tr> </table>	Format:	MBZ	
Format:	MBZ			

## BR16 - Pattern Expansion Background and Solid Pattern Color

### BR16 - Pattern Expansion Background and Solid Pattern Color

Project:	CHV, BSW
Source:	BlitterCS
Size (in bits):	32
Default Value:	0x00000000

DWord	Bit	Description
0	31:0	<p><b>Pattern Expansion Background Color Bits</b></p> <p>These bits provide the one, two, or four bytes worth of color data that select the background color to be used in the color expansion of monochrome pattern data during BLT operations. Whether one, two, or four bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.</p>

## BR17 - Pattern Expansion Foreground Color

BR17 - Pattern Expansion Foreground Color		
DWord	Bit	Description
0	31:0	<p><b>Pattern Expansion Background Color Bits</b></p> <p>These bits provide the one, two, or four bytes worth of color data that select the foreground color to be used in the color expansion of monochrome pattern data during BLT operations. Whether one, two, or four bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.</p>

## BR18 - Source Expansion Background and Destination Color

BR18 - Source Expansion Background and Destination Color		
DWord	Bit	Description
0	31:0	<p><b>Source Expansion Background Color Bits</b></p> <p>These bits provide the one, two, or four bytes worth of color data that select the background color to be used in the color expansion of monochrome source data during BLT operations. This register is also used to support destination transparency mode and Solid color fill. Whether one, two, three, or four bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.</p>

## BR19 - Source Expansion Foreground Color

BR19 - Source Expansion Foreground Color		
DWord	Bit	Description
0	31:0	<p><b>Pattern/Source Expansion Foreground Color Bits</b></p> <p>These bits provide the one, two, or four bytes worth of color data that select the foreground color to be used in the color expansion of monochrome source data during BLT operations. Whether one, two, or four bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.</p>

## BR27 - Destination Address Higher Order Address

BR27 - Destination Address Higher Order Address				
DWord	Bit	Description		
0	31:16	<b>Reserved</b> <table border="1"> <tr> <td>Format:</td> <td>MBZ</td> </tr> </table>	Format:	MBZ
Format:	MBZ			
15:0	<b>Destination Address Upper DWORD</b> <table border="1"> <tr> <td>Format:</td> <td>GraphicsAddress[47:32]</td> </tr> </table> <p>When tiling is enabled for XY-blits, this base address should be limited to 4KB. Otherwise for XY blits, there is no restriction and it is same as before. These upper 16bits of the 48bit address, along with BR09 register, will specify the starting pixel address of the destination data. This register is also the working destination address register for the upper 16bits of the destination address, and changes as the BLT Engine performs the accesses. Used as the scan line address (Destination Y Address and Destination Y1 Address) for BLT instructions: PIXEL_BLT, SCANLINE_BLT, and TEXT_BLT. In this case the address points to the first pixel in a scan line and is compared with the ClipRect Y1 and Y2 address registers to determine whether the scan line should be written or not. The Destination Y1 address is the top scan line to be written for text. Note that for non-XY blits (COLOR_BLT, SRC_COPY_BLT), this 16bits of the 48bit address, along with BR09 register, points to the first byte to be written. This register is always the last register written for a BLT drawing instruction. Writing BR27 starts the BLT engine execution. Note: Some instructions affect only one scan line (requiring only one coordinate); other instructions affect multiple scan lines and need both coordinates.</p>	Format:	GraphicsAddress[47:32]	
Format:	GraphicsAddress[47:32]			

## BR28 - Source Address Higher order Address

BR28 - Source Address Higher order Address

GPU supports 64b (48bit canonical) PPGTT graphics virtual addressing and PDP0_DESCRIPTOR contains the base address to PML4 and other PDP Descriptors are ignored.																					
<b>Programming Notes</b>			<b>Project</b>																				
Advanced context and 64 bit Virtual addressing are not supported on CHV, BSW. Only legal value that must be programmed on CHV, BSW is "01b: Legacy Context with no 64 bit VA support".			CHV, BSW																				
2	<b>Force Restore</b> Setting this bit will force a context restore operation when switching to this context even if the LRCA in the CCID register (normally the LRCA of the last context from the prior execlist) matches this one. Note that it is legal (and likely desirable) for the <b>Render Context Restore Inhibit</b> bit (part of the CTXT_SR_CTRL register) in the context image being restored to also be set. The "ring" context is being forced to be restored from a newly initialized context despite a possible LRCA match.																						

## Context Descriptor Format

		However, the render context for such a newly initialized context will likely be uninitialized and so should not be restored.								
		<table border="1"> <thead> <tr> <th>Programming Notes</th><th>Project</th><th>Source</th></tr> </thead> <tbody> <tr> <td>Force Restore bit must be always be set on all context submissions, when SW intends to use semaphore signaling (MI_SEMAPHORE_SIGNAL) between command streamers, this is to address known HW issue.</td><td>CHV, BSW</td><td>PRMPRM</td></tr> </tbody> </table>	Programming Notes	Project	Source	Force Restore bit must be always be set on all context submissions, when SW intends to use semaphore signaling (MI_SEMAPHORE_SIGNAL) between command streamers, this is to address known HW issue.	CHV, BSW	PRMPRM		
Programming Notes	Project	Source								
Force Restore bit must be always be set on all context submissions, when SW intends to use semaphore signaling (MI_SEMAPHORE_SIGNAL) between command streamers, this is to address known HW issue.	CHV, BSW	PRMPRM								
	1	<p><b>Force PD Restore</b></p> <p>Setting this bit will cause the on-chip page directory to be reloaded from the PD image in memory even on an LRCA match. No other operations of context restore will occur on an LRCA match, however. Software should set this bit if it has updated a context's page directory and wants the context to begin using the new page directory without having to switch away from it (to another context) and back again. Setting this bit will have no effect if <b>Force Restore</b> is also set; a complete context restore (including the PD) will be performed.</p>								
	0	<p><b>Valid</b></p> <p>Set if this register holds a valid context descriptor. SW should set this bit in the Element registers that it has set up to contain valid context descriptors. Any execlist elements that are not used in a submitted execlist must have this bit clear.</p>

## Data Port 1 Message Types

### MT\_DP1 - Data Port 1 Message Types

Project: CHV, BSW  
 Source: DataPort 1  
 Size (in bits): 5  
 Default Value: 0x00000000

Lists all the Message Types in a Data Port 1 Message Descriptor [18:14]. Most surface and atomic operations, both typed and untyped, are encoded on Data Port 1. The Message Header is optional for many (but not all) of these operations. Most A64 Stateless operations are also encoded on Data Port 1. The Message Header is forbidden for all A64 messages on Data Port 1.

DWord	Bit	Description

		Format:	Enumeration
		Specifies the number of Bytes to be read or written	
Value		Name	Description
00h		B	1 Byte
01h		W	2 Bytes
02h		DW	4 Bytes
03h		Reserved	Reserved

## DstRegNum

<b>DstRegNum</b>											
Project: CHV, BSW Source: Eulsa Size (in bits): 8 Default Value: 0x00000000											
<b>Description</b>		<b>Project</b>									
Register Number The register number for the operand. For a GRF register, is the part of a register address that aligns to a 256-bit (32-byte) boundary. For an ARF register, this field is encoded such that MSBs identify the architecture register type and LSBs provide the register number. An ARF register can only be dst or src0. Any src1 or src2 operands cannot be ARF registers. RegNum and SubRegNum together provide the byte-aligned address for the origin of a register region. RegNum provides bits 12:5 of that address. For one-source and two-source instructions, SubregNum provides bits 4:0. For three-source instructions, the address must be DWord-aligned; SubRegNum provides bits 4:2 of the address and bits 1:0 are zero. This field is present for the direct addressing mode and not present for indirect addressing. This field applies to both source and destination operands.		CHV, BSW									
<b>DWord</b>	<b>Bit</b>	<b>Description</b>									
0	7:0	<b>Destination Register Number</b> <table border="1"> <thead> <tr> <th><b>Value</b></th><th><b>Name</b></th><th><b>Description</b></th></tr> </thead> <tbody> <tr> <td>0-127</td><td>If {Dst/Src0/Src1/Src2}.RegFile==GRF</td><td></td></tr> <tr> <td>0-Offh</td><td>If {Dst/Src0/Src1/Src2}.RegFile==ARF</td><td>This field is used to encode the architecture register as well as providing the register number. See GEN Execution Environment chapter for details.</td></tr> </tbody> </table>	<b>Value</b>	<b>Name</b>	<b>Description</b>	0-127	If {Dst/Src0/Src1/Src2}.RegFile==GRF		0-Offh	If {Dst/Src0/Src1/Src2}.RegFile==ARF	This field is used to encode the architecture register as well as providing the register number. See GEN Execution Environment chapter for details.
<b>Value</b>	<b>Name</b>	<b>Description</b>									
0-127	If {Dst/Src0/Src1/Src2}.RegFile==GRF										
0-Offh	If {Dst/Src0/Src1/Src2}.RegFile==ARF	This field is used to encode the architecture register as well as providing the register number. See GEN Execution Environment chapter for details.									

## DstSubRegNum

<b>DstSubRegNum</b>			
Project:	CHV, BSW		
Source:	Eulsa		
Size (in bits):	5		
Default Value:	0x00000000		
Description	Project		
Subregister Number The subregister number for the operand. For a GRF register, is the byte address within a 256-bit (32-byte) register. For an ARF register, determines the sub-register number according to the specified encoding for the given architecture register. RegNum and SubRegNum together provide the byte-aligned address for the origin of a GRF register region. RegNum provides bits 12:5 of that address. For one-source and two-source instructions, SubregNum provides bits 4:0. For three-source instructions, the address must be DWord-aligned; SubRegNum provides bits 4:2 of the address and bits 1:0 are zero.	CHV, BSW		
<b>Programming Notes</b>			
Note: The recommended instruction syntax uses subregister numbers within the GRF in units of actual data element size, corresponding to the data type used. For example for the F (Float) type, the assembler syntax uses subregister numbers 0 to 7, corresponding to subregister byte addresses of 0 to 28 in steps of 4, the element size.			
DWord	Bit	<b>Description</b>	
0	4:0	<b>Destination Sub Register Number</b>	
Value	Name	<b>Description</b>	
0-31	If {Dst/Src0/Src1/Src2}.RegFile==GRF		
0- 0ffh	If {Dst/Src0/Src1/Src2}.RegFile==ARF	This field is used to encode the architecture register as well as providing the register number. See GEN Execution Environment chapter for details.	

## Dword Data Payload Register

MDCR_DW - Dword Data Payload Register						
DWord	Bit	Description				
0.0	31:0	<p><b>Dword0</b></p> <table border="1"> <tr> <td>Project:</td><td>All</td></tr> <tr> <td>Format:</td><td>U32</td></tr> </table> <p>Specifies the slot 0 data in this payload register</p>	Project:	All	Format:	U32

## DX9\_CONSTANTB\_ENTRY

DX9_CONSTANTB_ENTRY				
DWord	Bit	Description		
0	31:0	<p><b>Component</b></p> <table border="1"> <tr> <td>Format:</td><td>U32</td></tr> </table> <p>The boolean value to be stored.</p>	Format:	U32
Format:	U32			
This structure is the payload of the 3DSTATE_DX9_CONSTANTB_* commands. Each entry provides the values for the one boolean constant being updated.				

## DX9\_CONSTANTF\_ENTRY

DX9_CONSTANTF_ENTRY				
DWord	Bit	Description		
0	127:96	<p><b>Component 3</b></p> <table border="1"> <tr> <td>Format:</td> <td>IEEE_Float</td> </tr> </table> <p>The 4th component of the nth float to be stored.</p>	Format:	IEEE_Float
Format:	IEEE_Float			
95:64	<p><b>Component 2</b></p> <table border="1"> <tr> <td>Format:</td> <td>IEEE_Float</td> </tr> </table> <p>The 3rd component of the nth float to be stored.</p>	Format:	IEEE_Float	
Format:	IEEE_Float			
63:32	<p><b>Component 1</b></p> <table border="1"> <tr> <td>Format:</td> <td>IEEE_Float</td> </tr> </table> <p>The 2nd component of the nth float to be stored.</p>	Format:	IEEE_Float	
Format:	IEEE_Float			
31:0	<p><b>Component 0</b></p> <table border="1"> <tr> <td>Format:</td> <td>IEEE_Float</td> </tr> </table> <p>The 1st component of the nth float to be stored.</p>	Format:	IEEE_Float	
Format:	IEEE_Float			

## DX9\_CONSTANTI\_ENTRY

DX9_CONSTANTI_ENTRY				
DWord	Bit	Description		
0	31:0	<p><b>Component 0</b></p> <table border="1"> <tr> <td>Format:</td> <td>U32</td> </tr> </table> <p>The 1st component of the nth float to be stored.</p>	Format:	U32
Format:	U32			
This structure is the payload of the 3DSTATE_DX9_CONSTANTI_* commands. Each entry provides the values for the four components of one integer constant being updated.				
1	31:0	<p><b>Component 1</b></p> <table border="1"> <tr> <td>Format:</td> <td>U32</td> </tr> </table> <p>The 2nd component of the nth float to be stored.</p>	Format:	U32
Format:	U32			
2	31:0	<p><b>Component 2</b></p> <table border="1"> <tr> <td>Format:</td> <td>U32</td> </tr> </table> <p>The 3rd component of the nth float to be stored.</p>	Format:	U32
Format:	U32			
3	31:0	<p><b>Component 3</b></p> <table border="1"> <tr> <td>Format:</td> <td>U32</td> </tr> </table> <p>The 4th component of the nth float to be stored.</p>	Format:	U32
Format:	U32			

## Encoder Statistics Format

Encoder Statistics Format											
DWord	Bit	Description									
0	31:24	<b>Tearing_Count 1 (FMD Variance[8])</b>									
		Format:	U8								
		Number of pixels that have (diff_cTcB > diff_cTcT + diff_cBcB)									
		<table border="1"> <thead> <tr> <th>Value</th><th>Name</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td></td><td>DI is Disabled</td></tr> </tbody> </table>	Value	Name	Description	0		DI is Disabled			
Value	Name	Description									
0		DI is Disabled									
	23:16	<b>Tearing_Count 2</b>									
		Format:	U8								
		If the frame is Deinterlaced with Top First in the DN/DI state then this is (FMD Variance[9]) = Number of pixels that have (diff_cTpB > diff_cTcT + diff_pBpB)									
		If the frame is bottom first then this is (FMD Variance[10]) = Number of pixels that have (diff_cBpT > diff_pTpT + diff_cBcB)									
		<table border="1"> <thead> <tr> <th>Value</th><th>Name</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td></td><td>DI is Disabled</td></tr> </tbody> </table>	Value	Name	Description	0		DI is Disabled			
Value	Name	Description									
0		DI is Disabled									
	15:8	<b>Motion_Count (FMD Variance[7])</b>									
		Format:	U8								
		Number of pixels that are moving (different above a threshold)									
		<table border="1"> <thead> <tr> <th>Value</th><th>Name</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td></td><td>DI is Disabled</td></tr> </tbody> </table>	Value	Name	Description	0		DI is Disabled			
Value	Name	Description									
0		DI is Disabled									
	7:0	<b>Reserved</b>									
		Format:	MBZ								
1	31:28	<b>sSTAD</b>									
		Format:	U4								
		Shift for the Sum in time of absolute differences for 16x4.									
		<table border="1"> <thead> <tr> <th>Value</th><th>Name</th><th>Description</th><th>Project</th></tr> </thead> <tbody> <tr> <td>0</td><td></td><td>DN is Disabled</td><td>CHV, BSW</td></tr> </tbody> </table>	Value	Name	Description	Project	0		DN is Disabled	CHV, BSW	
Value	Name	Description	Project								
0		DN is Disabled	CHV, BSW								

## Encoder Statistics Format

	27:24	<b>sSHCM</b>						
		Format: U4						
Shift for the Sum horizontally of absolute differences.								
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #e0e0ff; text-align: center;">Value</th><th style="background-color: #e0e0ff; text-align: center;">Name</th><th style="background-color: #e0e0ff; text-align: center;">Description</th></tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td><td></td><td>DN is Disabled</td></tr> </tbody> </table>	Value	Name	Description	0		DN is Disabled
Value	Name	Description						
0		DN is Disabled						
	23:20	<b>sSVCM</b>						
		Format: U4						
Shift for the Sum vertically of absolute differences.								
	19:16	<b>sDiff_cTpT</b>						
		Format: U4						
Shift for the sum of differences in top fields of current and previous frame.								
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #e0e0ff; text-align: center;">Value</th><th style="background-color: #e0e0ff; text-align: center;">Name</th><th style="background-color: #e0e0ff; text-align: center;">Description</th></tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td><td></td><td>DI is Disabled</td></tr> </tbody> </table>	Value	Name	Description	0		DI is Disabled
Value	Name	Description						
0		DI is Disabled						
	15:12	<b>sDiff_cBpB</b>						
		Format: U4						
Shift for the sum of differences in bottom field of current and previous frame.								
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #e0e0ff; text-align: center;">Value</th><th style="background-color: #e0e0ff; text-align: center;">Name</th><th style="background-color: #e0e0ff; text-align: center;">Description</th></tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td><td></td><td>DI is Disabled</td></tr> </tbody> </table>	Value	Name	Description	0		DI is Disabled
Value	Name	Description						
0		DI is Disabled						
	11:8	<b>sDiff_cTcB</b>						
		Format: U4						
Shift for the sum of differences between top and bottom field in current frame.								
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #e0e0ff; text-align: center;">Value</th><th style="background-color: #e0e0ff; text-align: center;">Name</th><th style="background-color: #e0e0ff; text-align: center;">Description</th></tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td><td></td><td>DI is Disabled</td></tr> </tbody> </table>	Value	Name	Description	0		DI is Disabled
Value	Name	Description						
0		DI is Disabled						
	7:4	<b>sDiff_cTpB</b>						
		Format: U4						
Shift for the sum of differences between current top and previous bottom.								
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #e0e0ff; text-align: center;">Value</th><th style="background-color: #e0e0ff; text-align: center;">Name</th><th style="background-color: #e0e0ff; text-align: center;">Description</th></tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td><td></td><td>DI is Disabled</td></tr> </tbody> </table>	Value	Name	Description	0		DI is Disabled
Value	Name	Description						
0		DI is Disabled						
	3:0	<b>sDiff_cBpT</b>						
		Format: U4						
Shift for the sum of differences between current bottom and previous top.								
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #e0e0ff; text-align: center;">Value</th><th style="background-color: #e0e0ff; text-align: center;">Name</th><th style="background-color: #e0e0ff; text-align: center;">Description</th></tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td><td></td><td>DI is Disabled</td></tr> </tbody> </table>	Value	Name	Description	0		DI is Disabled
Value	Name	Description						
0		DI is Disabled						
2	31:24	<b>mDiff_cBpB (FMD Variance[1])</b>						
		Format: U8						
Mantissa of sum of differences in bottom field of current and previous frame.								

## Encoder Statistics Format

<b>Value</b>				<b>Name</b>		<b>Description</b>			
0				DI is Disabled					
23:16				<b>mDiff_cTcB (FMD Variance[2])</b>					
Format:				U8		Mantissa of sum of differences between top and bottom field in current frame.			
<b>Value</b>				<b>Name</b>		<b>Description</b>			
0				DI is Disabled

## EU\_INSTRUCTION\_COMPACT\_TWO\_SRC

EU_INSTRUCTION_COMPACT_TWO_SRC			
DWord	Bit	Description	
0..1	63:56	<b>Src1.RegNum</b>	
		Exists If:	([DataTypeIndex][Src1.RegFile]!='IMM')
		Format:	SrcRegNum [CHV, BSW]
		Maps to 108:101 (Src1.RegNum)	
	63:56	<b>Src1.RegNum</b>	
		Exists If:	([DataTypeIndex][Src1.RegFile]=='IMM')
		Maps to 103:96 (Imm32[7:0])	
	55:48	<b>Src0.RegNum</b>	
		Format:	SrcRegNum [CHV, BSW]
		Maps to 76:69 (Src0.RegNum)	
	47:40	<b>Dst.RegNum</b>	
		Format:	DstRegNum [CHV, BSW]
		Maps to 60:53 (Dst.RegNum)	
	39:35	<b>Src1Index</b>	
		Exists If:	([DataTypeIndex][Src1.RegFile]!='IMM')
		Format:	SrcIndex [CHV, BSW]
		If not an immediate operand, lookup one of 32 12-bit values that maps to bits 120:109. That value is used (from MSB to LSB) for the Src1.VertStride, various Src1 bit fields based on AccessMode (Src1.ChanSel[7:4], Src1.Width, Src1.HorzStride), Src1.AddrMode, and Src1.SrcMod bit fields	
		Maps to 120:109	
	39:35	<b>Src1Index</b>	
		Exists If:	([DataTypeIndex][Src1.RegFile]=='IMM')

## EU\_INSTRUCTION\_COMPACT\_TWO\_SRC

		If an immediate operand, there is no lookup. Determines bits 127:104 (Imm32[31:8]) as follows: map bits 39:35 directly to bits 108:104. Sign extend to fill bits 127:109. Compact format bit 39 is thus copied to all of bits 127:108 for an immediate operand.  Maps to 127:104																					
34:30	<b>Src0Index</b>	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 2px;">Format:</td> <td style="padding: 2px;">SrcIndex [CHV, BSW]</td> </tr> </table> <p>Lookup one of 32 12-bit values. Format:	PredCtrl [CHV, BSW]												

EU_INSTRUCTION_CONTROLS_A												
	7:6	<b>Thread Control</b>	<p>Format: ThreadCtrl [CHV, BSW]</p> <p>Thread Control. This field provides explicit control for thread switching. If this field is set to 00b, it is up to the GEN execution units to manage thread switching. This is the normal (and unnamed) mode. In this mode, for example, if the current instruction cannot proceed due to operand dependencies, the EU switches to the next available thread to fill the compute pipe. In another example, if the current instruction is ready to go, however, there is another thread with higher priority that also has an instruction ready, the EU switches to that thread. If this field is set to Switch, a forced thread switch occurs after the current instruction is executed and before the next instruction. In addition, a long delay (longer than the execution pipe latency) is introduced for the current thread. Particularly, the instruction queue of the current thread is flushed after the current instruction is dispatched for execution. Switch is designed primarily as a safety feature in case there are race conditions for certain instructions.</p>									
	5:4	<b>QtrCtrl</b>	<p>Format: QtrCtrl [CHV, BSW]</p> <p>Quarter Control. This field provides explicit control for ARF selection. This field combined with NibCtrl and ExecSize determines which channels are used for the ARF registers.</p>									
	3	<b>NibCtrl</b>	<p>Nibble Control. This field is used in some instructions along with QtrCtrl. See the description of QtrCtrl below. NibCtrl is only used for SIMD4 instructions with a DF (Double Float) source or destination.</p> <table border="1"> <thead> <tr> <th>Value</th><th>Name</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td>Odd</td><td>Use an odd 1/8th for DMask/VMask and ARF (first, third, fifth, or seventh depending on QtrCtrl).</td></tr> <tr> <td>1</td><td>Even</td><td>Use an even 1/8th for DMask/VMask and ARF (second, fourth, sixth, or eighth depending on QtrCtrl).</td></tr> </tbody> </table> <p><b>Programming Notes</b></p> <p>Note that if eighths are given zero-based indices from 0 to 7, then NibCtrl = 0 indicates even indices and NibCtrl = 1 indicates odd indices.</p>	Value	Name	Description	0	Odd	Use an odd 1/8th for DMask/VMask and ARF (first, third, fifth, or seventh depending on QtrCtrl).	1	Even	Use an even 1/8th for DMask/VMask and ARF (second, fourth, sixth, or eighth depending on QtrCtrl).

0	Odd	Use an odd 1/8th for DMask/VMask and ARF (first, third, fifth, or seventh depending on QtrCtrl).										
1	Even	Use an even 1/8th for DMask/VMask and ARF (second, fourth, sixth, or eighth depending on QtrCtrl).										
	2:1	<b>DepCtrl</b>	<p>Format: DepCtrl [CHV, BSW]</p> <p>Destination Dependency Control. This field selectively disables destination dependency check and clear for this instruction. When it is set to 00, normal destination dependency control is performed for the instruction hardware checks for destination hazards to ensure data integrity. Specifically, destination register dependency check is conducted before the instruction is made ready for execution. After the instruction is executed, the destination register scoreboard will be cleared when the destination operands retire. When bit 10 is set (NoDDClr), the destination register scoreboard will NOT be cleared when the destination operands retire. When bit 11 is set (NoDDChk), hardware does not check for destination register dependency before the instruction is made ready for execution. NoDDClr and NoDDChk are not mutual exclusive. When this field is</p>									

## EU\_INSTRUCTION\_CONTROLS\_A

	not all-zero, hardware does not protect against destination hazards for the instruction. This is typically used to assemble data in a fine grained fashion (e.g. matrix-vector compute with dot-product instructions), where the data integrity is guaranteed by software based on the intended usage of instruction sequences.						
0	<p><b>AccessMode</b></p> <p>Access Mode. This field determines the operand access for the instruction. It applies to all source and destination operands. When it is cleared (Align1), the instruction uses byte-aligned addressing for source and destination operands. Source swizzle control and destination mask control are not supported. When it is set (Align16), the instruction uses 16-byte-aligned addressing for all source and destination operands. Source swizzle control and destination mask control are supported in this mode.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr style="background-color: #d9e1f2;"> <th style="text-align: center; padding: 2px;">Value</th> <th style="text-align: center; padding: 2px;">Name</th> </tr> </thead> <tbody> <tr style="background-color: #f2f2f2;"> <td style="text-align: center; padding: 2px;">0</td> <td style="text-align: center; padding: 2px;">Align1 <b>[Default]</b></td> </tr> <tr> <td style="text-align: center; padding: 2px;">1</td> <td style="text-align: center; padding: 2px;">Align16</td> </tr> </tbody> </table>	Value	Name	0	Align1 <b>[Default]</b>	1	Align16

## EU\_INSTRUCTION\_CONTROLS\_B

EU_INSTRUCTION_CONTROLS_B								
DWord	Bit	Description						
0	3	<b>Reserved</b>						
		Exists If:	(Property[Saturation]=='false')					
	3	<b>Saturate</b>						
	3	Exists If:	(Property[Saturation]=='true')					
	Enables or disables destination saturation. When it is set, output values to the destination register are saturated. The saturation operation depends on the destination data type. Saturation is the operation that converts any value outside the saturation target range for the data type to the closest value in the target range. For a floating-point destination type, the saturation target range is [0.0, 1.0]. For a floating-point NaN, there is no closest value; any NaN saturates to 0.0. Note that enabling Saturate overrides all of the NaN propagation behaviors described for various numeric instructions. Any floating-point number greater than 1.0, including +INF, saturates to 1.0. Any negative floating-point number, including -INF, saturates to 0.0. Any floating-point number in the range 0.0 to 1.0 is not changed by saturation. For an integer destination type, the maximum range for that type is the saturation target range. For example, the saturation range for B (Signed Byte Integer) is [-128, 127]. When Saturate is clear, destination values are not saturated. For example, a wrapped result (modulo) is output to the destination for an overflowed integer value. See the Numeric Data Types section for information about data types and their ranges.

	31	<b>Source 0 Address Immediate [9] (Sign Bit)</b>	Exists If: ([Source 0][Source Addressing Mode]=='Indirect') Format: S9[9]
	30:27	<b>Src1.SrcType</b>	Format: SrcType [CHV, BSW]  This field specifies the numeric data type of the source operand src1. The bits of a source operand are interpreted as the identified numeric data type, rather than coerced into a type implied by the operator. Depending on RegFile field of the source operand, there are two different encoding for this field. If a source is a register operand, this field follows the Source Register Type Encoding. If a source is an immediate operand, this field follows the Source Immediate Type Encoding.
Value		Name	

## EU\_INSTRUCTION\_SOURCES\_REG\_REG

		11b	Reserved
<b>Programming Notes</b>			
Both source operands, src0 and src1, support immediate types, but only one immediate is allowed for a given instruction and it must be the last operand.			
Halfbyte integer vector (v) type can only be used in instructions in packed-word execution mode. Therefore, in a two-source instruction where src1 is of type :v, src0 must be of type :b, :ub, :w, or :uw.			
26:25	<b>Src1.RegFile</b>	Format:	RegFile [CHV, BSW]
24:0	<b>Source 0</b>	Exists If:	(Structure[EU_INSTRUCTION_CONTROLS_A][AccessMode]=='Align16') AND (Structure[EU_INSTRUCTION_OPERAND_CONTROLS][Src0.RegFile]!='IMM')

## Header Forbidden Message Descriptor Control Field

### MDC\_MHF - Header Forbidden Message Descriptor Control Field

Project: CHV, BSW  
 Source: PRM  
 Size (in bits): 1  
 Default Value: 0x00000000

DWord	Bit	Description		
0	0	<b>Message Header Present</b>		
		Project:	All	
		Format:	Enumeration	
Indicates the message forbids a message header.				
Value	Name	Description		Project
0h	No [ <b>Default</b> ]	Message header is not present		All
1h	Reserved	Not used		All

## Header Present Message Descriptor Control Field

### MDC\_MHP - Header Present Message Descriptor Control Field

Project:	CHV, BSW
Source:	PRM
Size (in bits):	1
Default Value:	0x00000000

DWord	Bit	Description			
0	0	<b>Message Header Present</b>			
		Project: All Format: Enumeration			
Specifies if the message uses the optional message header.					
Value	Name	Description			Project
0h	No	Message header is not present			All
1h	Yes	Message header is present			All

## Header Required Message Descriptor Control Field

### MDC\_MHR - Header Required Message Descriptor Control Field

Project: CHV, BSW  
 Source: PRM  
 Size (in bits): 1  
 Default Value: 0x00000001

DWord	Bit	Description					
0	0	<b>Message Header Present</b>					
		Project:					
		All					
		Format:					
		Enumeration					
		Indicates the message requires a message header.					
Value	Name	Description			Project		
0h	Reserved	Not used			All		
1h	Yes [Default]	Message header is present			All		

## HEVC\_ARBITRATION\_PRIORITY

HEVC_ARBITRATION_PRIORITY														
Project: CHV, BSW														
Source: PRM														
Size (in bits): 2														
Default Value: 0x00000000														
This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface.														
DWord	Bit	Description												
0	1:0	<p><b>Priority</b></p> <table border="1"> <tr> <td>Format:</td><td>U2</td></tr> <tr> <th>Value</th><th>Name</th></tr> <tr> <td>00b</td><td>Highest priority</td></tr> <tr> <td>01b</td><td>Second highest priority</td></tr> <tr> <td>10b</td><td>Third highest priority</td></tr> <tr> <td>11b</td><td>Lowest priority</td></tr> </table>	Format:	U2	Value	Name	00b	Highest priority	01b	Second highest priority	10b	Third highest priority	11b	Lowest priority
Format:	U2													
Value	Name													
00b	Highest priority													
01b	Second highest priority													
10b	Third highest priority													
11b	Lowest priority													

## HW Generated BINDING\_TABLE\_STATE

HW Generated BINDING_TABLE_STATE

## INTERFACE\_DESCRIPTOR\_DATA

INTERFACE_DESCRIPTOR_DATA					
DWord	Bit	Description			
0	31:6	<b>Kernel Start Pointer</b>			
	Format:	InstructionBaseOffset[31:6]Kernel			
1	5:0	<b>Reserved</b>			
	Format:	MBZ			
2	31:16	<b>Reserved</b>			
	Format:	MBZ			
19	15:0	<b>Kernel Start Pointer High</b>			
	Format:	InstructionBaseOffset[47:32]Kernel			
19	This field specifies the high 16 bits of starting address of the Kernel Pointer.				
19	31:20	<b>Reserved</b>			
	Project:	CHV, BSW			
19	Format:	MBZ			
18	19	<b>Denorm Mode</b>			
	This field specifies how Float denormalized numbers are handles in the dispatched thread.				
18	Value	Name	Description		
	0h	Ftz	Float denorms will be flushed to zero when appearing as inputs, denorms will never come out of instructions. Double precision float and half precision float numbers are not flushed to zero.		
18	1h	SetByKernel	Denorms will be handled in by kernel.		
18	<b>Single Program Flow</b>				
	Specifies whether the kernel program has a single program flow (SIMDnxm with m = 1) or multiple program flows (SIMDnxm with m > 1).				
18	Value		Name		
	0h		Multiple		
18	1h		Single		
17	<b>Thread Priority</b>				

## INTERFACE\_DESCRIPTOR\_DATA

		Specifies the priority of the thread for dispatch.	
		<b>Value</b>	<b>Name</b>
		0h	Normal Priority
		1h	High Priority
16	<b>Floating Point Mode</b> Specifies the floating point mode used by the dispatched thread.		
		<b>Value</b>	<b>Name</b>
		0h	IEEE-754
		1h	Alternate
15:14	<b>Reserved</b>		
		Format:	MBZ
13	<b>Illegal Opcode Exception Enable</b> This bit gets loaded into EU CR0.1[12] (note the bit # difference). See <i>Exceptions and ISA Execution Environment</i> .		
		Format:	Enable
12	<b>Reserved</b>		
		Format:	MBZ
11	<b>Mask Stack Exception Enable</b> This bit gets loaded into EU CR0.1[11]. See <i>Exceptions and ISA Execution Environment</i> .		
		Format:	Enable
10:8	<b>Reserved</b>		
		Format:	MBZ
7	<b>Software Exception Enable</b> This bit gets loaded into EU CR0.1[13] (note the bit # difference). See <i>Exceptions and ISA Execution Environment</i> .		
		Format:	Enable
6:0	<b>Reserved</b>		
		Format:	MBZ
3	31:5	<b>Sampler State Pointer</b> Specifies the 32-byte aligned address offset of the sampler state table. This pointer is relative to the <b>Dynamic State Base Address</b> . <i>This field is ignored for child threads.</i>	
		Format:	DynamicStateOffset[31:5]SAMPLER_STATE
4:2	<b>Sampler Count</b>		
		Format:	U3

## INTERFACE\_DESCRIPTOR\_DATA

		<p>Specifies how many samplers (in multiples of 4) the kernel uses. Used only for prefetching the associated sampler state entries. <i>This field is ignored for child threads. If this field is not zero, sampler state is prefetched for the first instance of a root thread upon the startup of the media pipeline.</i></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center; background-color: #e0e0ff;">Value</th><th style="text-align: center; background-color: #e0e0ff;">Name</th></tr> </thead> <tbody> <tr><td>[0,4]</td><td></td></tr> <tr><td>0h</td><td>No samplers used</td></tr> <tr><td>1h</td><td>Between 1 and 4 samplers used</td></tr> <tr><td>2h</td><td>Between 5 and 8 samplers used</td></tr> <tr><td>3h</td><td>Between 9 and 12 samplers used</td></tr> <tr><td>4h</td><td>Between 13 and 16 samplers used</td></tr> </tbody> </table>	Value	Name	[0,4]		0h	No samplers used	1h	Between 1 and 4 samplers used	2h	Between 5 and 8 samplers used	3h	Between 9 and 12 samplers used	4h	Between 13 and 16 samplers used

## MEDIA\_SURFACE\_STATE

		<p>surface. The surface is interpreted as a simple array of that single element type. The address must be naturally-aligned to the element size (e.g., a buffer containing R32G32B32A32_FLOAT elements must be 16-byte aligned). For SURFTYPE_BUFFER non-rendertarget surfaces, this field specifies the base address of the first element of the surface, computed in software by adding the surface base address to the byte offset of the element in the buffer. Mipmapped, cube and 3D sampling engine surfaces are stored in a 'monolithic' (fixed) format, and only require a single address for the base texture. Linear render target surface base addresses must be element-size aligned, for non-YUV surface formats, or a multiple of 2 element-sizes for YUV surface formats. Other linear surfaces have no alignment requirements (byte alignment is sufficient.) Linear depth buffer surface base addresses must be 64-byte aligned. Note that while render targets (color) can be SURFTYPE_BUFFER, depth buffers cannot. Tiled surface base addresses must be 4KB-aligned. Note that only the offsets from Surface Base Address are tiled, Surface Base Address itself is not transformed using the tiling algorithm. For tiled surfaces, the actual start of the surface can be offset from the Surface Base Address by the X Offset and Y Offset fields. Certain message types used to access surfaces have more stringent alignment requirements. Please refer to the specific message documentation for additional restrictions.</p>

		Ignored	

## MH\_MBM - Merged Media Block Message Header

## Merged Media Block Message Header Control

### MHC\_MBM\_CONTROL - Merged Media Block Message Header Control

Project: CHV, BSW  
 Source: PRM  
 Size (in bits): 32  
 Default Value: 0x00000000

DWord	Bit	Description					
0	31:30	<b>Message Mode</b>					
		Project:	All				
		Format:	Enumeration				
Specifies the Media Block Read message is Normal subtype.							
	29	<b>Reserved</b>					
		Project:	All				
		Format:	Ignore				
		Ignored					
		<b>Sub-Register Offset</b>					
		Project:	All				
		Format:	U5				
		Provides the sub-register offset in unit of bytes of a Merged Media Block Read message. This field is ignored (reserved) for a media block write message. Range = [0, 28]. Only a multiple of BasePitch, including 0, is valid.					
		<b>Programming Notes</b>					
		Sub-Register Offset and Register Pitch Control allow software to assembly multiple media block reads directly into a shared GRF register set. For example, if both are set to zero, the read data are written to GRF registers, aligning to the least significant bits of the first register, and the register pitch is equal to the next power-of-2 that is greater than or equal to the Block Width. If Register Pitch Control is non-zero, multiple media block read messages sharing the same Register Pitch Control but with different Sub-Register Offset can fill in the same set of GRF registers with media block data line interleaved.					
		<b>Restriction</b>					
		For the Sampler Cache Data, this field must be zero.					

## MHC\_MBM\_CONTROL - Merged Media Block Message Header Control

		BasePitch is defined as the next power-of-2 that is greater than or equal to the Block Width. Minimum BasePitch is 1 DWord. Sub-Register Offset must be aligned to BasePitch (therefore will be a multiple of DWords as well). When Register Pitch Control = 0, Sub-Register Offset must align to BasePitch*Block Height, ensuring the output fits in a single GRF register. In general (and specifically when Sub-Register Offset is greater than 0), when the resulting data will cross a GRF register boundary, the data must be placed symmetrically between GRF registers.

## MsgDescpt31

MsgDescpt31						
DWord	Bit	Description				
0	28:25	<p><b>Message Length</b>  This field specifies the number of 256-bit MRF registers starting from &lt;curr_dest&gt; to be sent out on the request message payload. Valid value ranges from 1 to 15. A value of 0 is considered erroneous.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> </tr> </thead> <tbody> <tr> <td>1-15</td> <td>Number of MRF Registers</td> </tr> </tbody> </table>	Value	Name	1-15	Number of MRF Registers
Value	Name					
1-15	Number of MRF Registers					
24:20	<p><b>Response Length</b>  This field indicates the number of 256-bit registers expected in the message response. The valid value ranges from 0 to 16. A value 0 indicates that the request message does not expect any response. The largest response supported is 16 GRF registers.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> </tr> </thead> <tbody> <tr> <td>0-16</td> <td>Number of Registers</td> </tr> </tbody> </table>	Value	Name	0-16	Number of Registers	
Value	Name					
0-16	Number of Registers					
19	<p><b>Header Present</b>  Format: <input type="checkbox"/> Enable  If set, indicates that the message includes a header. Depending on the target shared function, this field may be restricted to either enabled or disabled. Refer to the specific shared function section for details.</p>					
18:0	<p><b>Function Control</b>  This field is intended to control the target function unit. Refer to the section on the specific target function unit for details on the contents of this field.</p>					

## Normal Media Block Message Header

<b>MH_MB - Normal Media Block Message Header</b>			
<b>DWord</b>	<b>Bit</b>	<b>Description</b>	
0	31:0	<b>X Offset</b>	
		Project:	All
		Format:	S31
		X offset (in bytes) of the upper left corner of the block into the surface.	
		<b>Programming Notes</b>	
1	31:0	<b>Y Offset</b>	
		Project:	All
		Format:	S31
		Y offset (in rows) of the upper left corner of the block into the surface.	
2	31:0	<b>Normal Media Block Message Control</b>	
		Project:	All
		Format:	MHC_MB_CONTROL [CHV, BSW]
3	31:0	<b>Mask</b>	
		Project:	All
		Format:	U32
		The Mask is ignored by the Normal Media Block message: all Dwords are always returned on reads, and always enabled to be written on writes.	
4	31:0	<b>FFTID</b>	
		Project:	All
		Format:	MHC_FFTID [CHV, BSW]
5-7	95:0	<b>Reserved</b>	
		Project:	All
		Format:	Ignore

## MH\_MB - Normal Media Block Message Header

		Ignored
--	--	---------

## Normal Media Block Message Header Control

<b>MHC_MB_CONTROL - Normal Media Block Message Header Control</b>													
<b>DWord</b>	<b>Bit</b>	<b>Description</b>											
0	31:30	<b>Message Mode</b>											
		Project:	All										
		Format:	Enumeration										
		Specifies the interpretation of M0.3 (Pixel or Byte Mask). For the Sampler Cache Data Port, this field is ignored, behaving as if always set to NORMAL.											
		<table border="1"> <thead> <tr> <th><b>Value</b></th> <th><b>Name</b></th> <th><b>Description</b></th> <th><b>Project</b></th> </tr> </thead> <tbody> <tr> <td>00h</td> <td>Normal</td> <td>The Block Height and Block Width fields are specified in this Dword. The Mask is ignored by a media block read message and behaves as if it is set to all ones for a media block write message.</td> <td>All</td> </tr> <tr> <td>Others</td> <td>Reserved</td> <td>Reserved.</td> <td>All</td> </tr> </tbody> </table>		<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>	00h	Normal	The Block Height and Block Width fields are specified in this Dword. The Mask is ignored by a media block read message and behaves as if it is set to all ones for a media block write message.	All	Others	Reserved
<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>										
00h	Normal	The Block Height and Block Width fields are specified in this Dword. The Mask is ignored by a media block read message and behaves as if it is set to all ones for a media block write message.	All										
Others	Reserved	Reserved.	All										
<b>Programming Notes</b>													
The Media Block Read message is Normal subtype when both Sub-Register Offset and Register Pitch Control are zero. The Media Block Read message is Merged subtype when either Sub-Register Offset or Register Pitch Control are non-zero.													
29	28:24	<b>Reserved</b>											
		Project:	All										
		Format:	Ignore										
Ignored													
<b>Sub-Register Offset</b>													
Project:		All											
Format:		MBZ											
The sub-register offset must be 0 for Normal Media Block Read message subtype. This field is ignored (reserved) for a media block write message.													
23:22	21:20	<b>Reserved</b>											
		Project:	All										
		Format:	Ignore										
Ignored													

## MHC\_MB\_CONTROL - Normal Media Block Message Header Control

21:16	<b>Block Height</b>	
	Project:	All
	Format:	U6
	Height in rows of block being accessed. Range = [0,63] representing 1 to 64 rows	
	<b>Restriction</b>	
	If Block Width (bytes), then Maximum Block Height (rows) is constrained by (# Dwords width) * (# rows) <= 64 Dwords.	
15:10	<b>Reserved</b>	
	Project:	All
	Format:	Ignore
	Ignored	
9:8	<b>Register Pitch Control</b>	
	Project:	All
	Format:	MBZ
	The register pitch must be 0 for a Normal Media Block Read message. This field is ignored (reserved) for a media block write message.	
7:6	<b>Reserved</b>	
	Project:	All
	Format:	Ignore
	Ignored	
5:0	<b>Block Width</b>	
	Project:	All
	Format:	U6
	Width in bytes of the block being accessed. For normal Media Block Writes, Range = [0,63] representing 1 to 64 Bytes. For normal Media Block Reads and for masked and merged Media Block messages, Range = [0,31] representing 1 to 32 Bytes.	
	<b>Programming Notes</b>	
	Must be DWord aligned for the write form of the message.

	15:0	<b>Pixel Sample Mask</b>				
		<table border="1"> <tr> <td>Default Value:</td> <td>0FFFFh Default</td> </tr> <tr> <td>Format:</td> <td>U16</td> </tr> <tr> <td colspan="2">SIMD16 and SIMD8 messages. All 16 bits are used for SIMD16. For untyped SIMD8 messages, the low 8 bits of field are used. If the header is not delivered, this field defaults to all ones. This field is ignored for SIMD4x2 messages.</td></tr> </table>	Default Value:	0FFFFh Default	Format:	U16
Default Value:	0FFFFh Default					
Format:	U16					
SIMD16 and SIMD8 messages. All 16 bits are used for SIMD16. For untyped SIMD8 messages, the low 8 bits of field are used. If the header is not delivered, this field defaults to all ones. This field is ignored for SIMD4x2 messages.						

## Pixel Sample Mask Render Target Message Header Control

<b>MHC_RT_PSM - Pixel Sample Mask Render Target Message Header Control</b>						
<b>DWord</b>	<b>Bit</b>	<b>Description</b>				
0	31:16	<p><b>Dispatched Pixel/Sample Enables</b></p> <table border="1"> <tr> <td>Project:</td> <td>All</td> </tr> <tr> <td>Format:</td> <td>U16</td> </tr> </table> <p>One bit per pixel (or sample within pixel) indicating which pixels/samples were originally enabled when the thread was dispatched. The Dispatched Pixel/Sample Enables must be unmodified from the ones sent when the pixel shader thread was initiated. If the Dispatched Pixel/Sample Enables are modified, behavior is undefined.</p>	Project:	All	Format:	U16
Project:	All					
Format:	U16					
<p style="text-align: center;"><b>Programming Notes</b></p> <p>When operating in PER_SAMPLE mode these bits correspond to samples, not pixels. Each subspan slot (4 bits) corresponds to a specific sample location for the subspan. Note that in NUMSAMPLES_1 mode, a pixel and sample are synonymous. When operating in PER_PIXEL mode, this field is ignored, and instead the SampleEnableMask (obtained via bypass) are used to clear the Depth Scoreboard.</p>						
	15:0	<p><b>Pixel/Sample Enables</b></p> <table border="1"> <tr> <td>Project:</td> <td>All</td> </tr> <tr> <td>Format:</td> <td>U16</td> </tr> </table> <p>Specifies which pixels/samples are still lit based on kill instruction activity in the pixel shader. This mask is AND'd with the Dispatched Pixel/Sample Enables mask, and that is used to control actual accesses to the color buffer. Pixels/samples will be dropped on masked writes, and the GRF is not modified for masked reads.</p>	Project:	All	Format:	U16
Project:	All					
Format:	U16					
<p style="text-align: center;"><b>Programming Notes</b></p> <p>When operating in PER_SAMPLE mode these bits correspond to samples, not pixels, as the PS is run per-sample. Each subspan slot (4 bits) corresponds to a specific sample location for the subspan. When operating in PER_PIXEL mode, these bits still correspond to pixels, as the PS is run per-pixel. Each pixels mask bit is replicated according to Number of Multisamples and combined with other masks to control writes to the multisample locations.</p>

2h	VALIGN 8	Vertical alignment factor j = 8																				

## RENDER\_SURFACE\_STATE

		3h	VALIGN 16	Vertical alignment factor j = 16																			
<b>Programming Notes</b>																							
This field is intended to be set to VALIGN_4 if the surface was rendered as a depth buffer, for a multisampled (4x) render target, or for a multisampled (8x) render target, since these surfaces support only alignment of 4. Use of VALIGN_4 for other surfaces is supported, but increases memory usage.																							
This field is intended to be set to VALIGN_8 only if the surface was rendered as a stencil buffer, since stencil buffer surfaces support only alignment of 8. If set to VALIGN_8, Surface Format must be R8_UINT.																							
For uncompressed surfaces, the units of "j" are rows of pixels on the physical surface. For compressed texture formats, the units of "j" are in compression blocks, thus each increment in "j" is equal to h pixels, where h is the height of the compression block in pixels.																							
15:14	<b>Surface Horizontal Alignment</b>																						
	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center; background-color: #0072bc; color: white;">Description</th><th style="text-align: center; background-color: #0072bc; color: white;">Project</th></tr> </thead> <tbody> <tr> <td>For Sampling Engine and Render Target Surfaces: This field specifies the horizontal alignment requirement for the surface. 0h	Reserved	Reserved																					
1h	HALIGN 4	Horizontal alignment factor j = 4																					
2h	HALIGN 8	Horizontal alignment factor j = 8																					
3h	HALIGN 16	Horizontal alignment factor j = 16																					
<b>Programming Notes</b>																							
13:12	This field is intended to be set to HALIGN_8 only if the surface was rendered as a depth buffer with Z16 format or a stencil buffer. In this case it must be set to HALIGN_8 since these surfaces support only alignment of 8. For Z32 formats it must be set to HALIGN_4. Use of HALIGN_8 for other surfaces is supported, but increases memory usage.																						
	For uncompressed surfaces, the units of "i" are pixels on the physical surface. For compressed texture formats, the units of "i" are in compression blocks, thus each increment in "i" is equal to w pixels, where w is the width of the compression block in pixels.																						
	When Auxiliary Surface Mode is set to AUX_CCS_D or AUX_CCS_E, HALIGN 16 must be used.																						
	<b>Tile Mode</b>																						
This field specifies the type of memory tiling (Linear, WMajor, XMajor, or YMajor) employed to																							

## RENDER\_SURFACE\_STATE

tile this surface. See *Memory Interface Functions* for details on memory tiling and restrictions.

Value	Name	Description	Project
0h	LINEAR	Linear mode (no tiling)	
1h	WMAJOR	W major tiling	CHV, BSW
2h	XMAJOR	X major tiling	
3h	YMAJOR	Y major tiling	

### Programming Notes

- Refer to *Memory Data Formats* for restrictions on *TileMode* direction for the various buffer types. (Of particular interest is the fact that YMAJOR tiling is not supported for display/overlay buffers).
- The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this field.
- Use of WMAJOR is valid only for sampling engine, Data Cache Data Port and render target surfaces and **Surface Format** must be R8\_UINT. Vertical Line Stride must be zero. In addition to W tiling, this mode implies that the surface is stored as a stencil buffer. Refer to *Memory Data Formats* section for details on stencil buffer surface layout.
- Linear surfaces can be mapped to Main Memory (uncached) or System Memory (cacheable, snooped). Tiled (X/Y/W) surfaces can only be mapped to Main Memory.
- If **Surface Type** is SURFTYPE\_BUFFER, this field must be TILEMODE\_LINEAR
- If **Number of Multisamples** is not MULTISAMPLECOUNT\_1, this field must be YMAJOR.

If **Surface Format** is ASTC\*, this field must be TILEMODE\_YMAJOR.

### 11 Vertical Line Stride

Format:	U1 In lines to skip between logically adjacent lines
---------	--

#### For 2D Non-Array Surfaces accessed via the Sampling Engine or Data Cache Data Port:

Specifies number of lines (0 or 1) to skip between logically adjacent lines - provides support of interleaved (field) surfaces as textures.

**For Other Surfaces:** Vertical Line Stride must be zero.

### Programming Notes

This bit must not be set if the surface format is a compressed type (BCn\*, FXT1, ETC\*, EAC\*, ASTC\*).

This bit must not be set if the **Auxiliary Surface Mode** is not AUX\_NONE.

If this bit is set on a sampling engine surface, the mip mode filter must be set to MIPFILTER\_NONE and the min and mag mode filter cannot be set to MAPFILTER\_FLEXIBLE.

### Workaround

### Project

All surfaces used by the sampler between sampler cache invalidates must have the same setting of this field in both RENDER\_SURFACE\_STATE and MEDIA\_SURFACE\_STATE.

CHV,  
BSW

## RENDER\_SURFACE\_STATE

	10	<b>Vertical Line Stride Offset</b>									
		<table border="1" style="width: 100%;"> <tr> <td style="width: 10%;">Format:</td><td>U1 In lines of initial offset (when Vertical Line Stride == 1)</td></tr> </table>	Format:	U1 In lines of initial offset (when Vertical Line Stride == 1)							
Format:	U1 In lines of initial offset (when Vertical Line Stride == 1)										
<b>For 2D Non-Array Surfaces accessed via the Sampling Engine or Data Cache Data Port:</b>											
Specifies the offset of the initial line from the beginning of the buffer. Ignored when Vertical Line Stride is 0.											
<b>For Other Surfaces:</b>											
Vertical Line Stride Offset must be zero.											
	9	<b>Sampler L2 Bypass Mode Disable</b>									
		<table border="1" style="width: 100%;"> <tr> <td style="width: 10%;">Format:</td><td>Disable</td></tr> </table>	Format:	Disable							
Format:	Disable										
This field allows the Sampler L2 bypass mode to be disabled for the surface. If enabled, Sampler can still disable the L2 bypass as needed.											
<b>Programming Notes</b>											
This bit must be set for the following surface types: BC2_UNORM BC3_UNORM BC5_UNORM BC5_SNORM BC7_UNORM											
	8	<b>Render Cache Read Write Mode</b>									
<b>For Surfaces accessed via the Data Port to Render Cache:</b>											
This field specifies the way Render Cache treats a write request. If unset, Render Cache allocates a write-only cache line for a write miss. If set, Render Cache allocates a read-write cache line for a write miss.											
<b>For Surfaces accessed via the Sampling Engine or Data Port to Texture Cache or Data Cache:</b>											
This field is reserved : MBZ											
		<table border="1" style="width: 100%;"> <thead> <tr> <th style="width: 10%;">Value</th><th style="width: 10%;">Name</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0h</td><td>Write-Only Cache</td><td>Allocating write-only cache for a write miss</td></tr> <tr> <td>1h</td><td>Read-Write Cache</td><td>Allocating read-write cache for a write miss</td></tr> </tbody> </table>	Value	Name	Description	0h	Write-Only Cache	Allocating write-only cache for a write miss	1h	Read-Write Cache	Allocating read-write cache for a write miss
Value	Name	Description									
0h	Write-Only Cache	Allocating write-only cache for a write miss									
1h	Read-Write Cache	Allocating read-write cache for a write miss									
<b>Programming Notes</b>											
This field is provided for performance optimization for Render Cache read/write accesses (from Gen4 EU's point of view).											
	7:6	<b>Media Boundary Pixel Mode</b>									
<b>For 2D Non-Array Surfaces accessed via the Data Port Media Block Read Message or Data Port Transpose Read message:</b>											
This field enables control of which rows are returned on vertical out-of-bounds reads using the Data Port Media Block Read Message or Data Port Transpose Read message. In the description below, frame mode refers to <b>Vertical Line Stride</b> = 0, field mode is <b>Vertical Line Stride</b> = 1 in which only the even or odd rows are addressable. The frame refers to the entire surface, while the field refers only to the even or odd rows within the surface.											
<b>For Other Surfaces:</b>											
Reserved : MBZ											
		<table border="1" style="width: 100%;"> <thead> <tr> <th style="width: 10%;">Value</th><th style="width: 10%;">Name</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0h</td><td>NORMAL_MODE</td><td>The row returned on an out-of-bound access is the closest row</td></tr> </tbody> </table>	Value	Name	Description	0h	NORMAL_MODE	The row returned on an out-of-bound access is the closest row			
Value	Name	Description									
0h	NORMAL_MODE	The row returned on an out-of-bound access is the closest row									

## RENDER\_SURFACE\_STATE

			in the frame or field. Rows from the opposite field are never returned.		
	1h	Reserved			
	2h	PROGRESSIVE_FRAME	The row returned on an out-of-bound access is the closest row in the frame, even if in field mode.		
	3h	INTERLACED_FRAME	In field mode, the row returned on an out-of-bound access is the closest row in the field. In frame mode, even out-of-bound rows return the nearest even row while odd out-of-bound rows return the nearest odd row.		
5	<b>Cube Face Enable - Negative X</b>				
	Exists If:	[Surface Type] == 'SURFTYPE_CUBE'			
	Format:	Enable			
	<p><b>For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine:</b> This field enable the individual face of a cube map. ## RENDER\_SURFACE\_STATE

		<b>Description</b>		<b>Project</b>		
		This field specifies the distance in rows between array slices. It is used only in the following cases:		CHV, BSW		
<ul style="list-style-type: none"> <li>• <b>Surface Array</b> is enabled OR</li> <li>• <b>Number of Multisamples</b> is not NUMSAMPLES_1 and <b>Multisampled Surface Storage Format</b> set to MSFMT_MSS OR</li> <li>• <b>Surface Type</b> is SURFTYPE_CUBE</li> </ul>						
<b>Value</b>		<b>Name</b>		<b>Description</b>		
[4h,1FFFCh]				in multiples of 4 (low 2 bits missing)		
<b>Programming Notes</b>						
<p>This field must be set to an integer multiple of the <b>Surface Vertical Alignment</b>. For compressed textures (BC*, FXT1, ETC*, EAC*, ASTC Surface Formats), this field is in units of rows in the uncompressed surface, and must be set to an integer multiple of the vertical alignment parameter "j" defined in the <i>Common Surface Formats</i> section.</p> <p>Software must ensure that this field is set to a value sufficiently large such that the array slices in the surface do not overlap. Refer to the Memory Data Formats section for information on how surfaces are stored in memory.</p>						
2	31:30	<b>Reserved</b>				
		Format:		MBZ		
	29:16	<b>Height</b>				
		Format:		U14-1		
		This field specifies the height of the surface, minus 1. If the surface is MIP-mapped, this field contains the height of the base MIP level. For buffers, this field specifies a portion of the buffer size.				
<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>	<b>Exists If</b>		
[0,0]		must be zero		[Surface Type] == 'SURFTYPE_1D'		
[0,16383]		height of surface - 1 (y/v dimension)		[SurfaceType] == 'SURFTYPE_2D'		
[0,2047]		height of surface - 1 (y/v dimension)	CHV, BSW	[SurfaceType] == 'SURFTYPE_3D'		
[0,16383]		height of surface - 1 (y/v dimension)		[SurfaceType] == 'SURFTYPE_CUBE'		
[0,16383]		contains bits [20:7] of the number of entries in the buffer - 1		([SurfaceType] == 'SURFTYPE_BUFFER')    ([SurfaceType] == 'SURFTYPE_STRBUF')		
<b>Programming Notes</b>						
For typed buffer and structured buffer surfaces, the number of entries in the buffer						

## RENDER\_SURFACE\_STATE

		<p>ranges from 1 to <math>2^{27}</math>. For raw buffer surfaces, the number of entries in the buffer is the number of bytes which can range from 1 to <math>2^{30}</math>. After subtracting one from the number of entries, software must place the fields of the resulting 27-bit value into the <b>Height</b>, <b>Width</b>, and <b>Depth</b> fields as indicated, right-justified in each field. Unused upper bits must be set to zero.</p>		
		If <b>Vertical Line Stride</b> is 1, this field indicates the height of the field, not the height of the frame		
		The <b>Height</b> of a render target must be the same as the <b>Height</b> of the other render targets and the depth buffer (defined in 3DSTATE_DEPTH_BUFFER), unless <b>Surface Type</b> is SURFTYPE_1D or SURFTYPE_2D with <b>Depth</b> = 0 (non-array) and <b>LOD</b> = 0 (non-mip mapped).		
		If this surface in memory is accessed with Vertical Line Stride set to both 0 and 1, this field must be an even value when Vertical Line Stride is 0.		
		If Media Pixel Boundary Mode is not set to NORMAL_MODE, this field must be an even value.		
		If Surface Format is PLANAR*, this field must be a multiple of 4	CHV, BSW

## RENDER\_SURFACE\_STATE

		buffer - 1					
<b>Programming Notes</b>							
The <b>Depth</b> of a render target must be the same as the <b>Depth</b> of the other render target(s) and of the depth buffer (defined in 3DSTATE_DEPTH_BUFFER).							
For SURFTYPE_CUBE: For Sampling Engine Surfaces, the range of this field is [0,340], indicating the number of cube array elements (equal to the number of underlying 2D array elements divided by 6). For other surfaces, this field must be zero.							
For SURFTYPE_BUFFER: The range of this field is [0,63] unless the Surface Format is RAW and Surface Pitch is 1 byte.							
For SURFTYPE_1D, 2D, and CUBE: The range of this field is reduced by one for each increase from zero of <b>Minimum Array Element</b> . For example, if <b>Minimum Array Element</b> is set to 1024 on a 2D surface, the range of this field is reduced to [0,1023].

## RENDER\_SURFACE\_STATE

- For 90 and 270 degree rotated surfaces, the actual **Height** and **Width** of the surface in pixels (not the field value which is decremented) must both be even.

Rotation is supported only for surfaces with the following surface formats: B5G6R5\_UNORM, B5G6R5\_UNORM\_SRGB, R8G8B8A8\_UNORM, R8G8B8A8\_UNORM\_SRGB, B8G8R8[A|X]8\_UNORM, B8G8R8[A|X]8\_UNORM\_SRGB, B10G10R10[A|X]2\_UNORM, B10G10R10A2\_UNORM\_SRGB, R10G10B10A2\_UNORM, R10G10B10A2\_UNORM\_SRGB, R16G16B16A16\_FLOAT, R16G16B16X16\_FLOAT

### 28:18 Minimum Array Element

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'
Format:	U11

### 17:7 Render Target View Extent

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'
Format:	U11-1

Range [0,2047] to indicate extent of [1,2048]

#### For Render Target and Typed Dataport 3D Surfaces:

This field indicates the extent of the accessible 'R' coordinates minus 1 on the LOD currently being rendered to.

#### For Render Target and Typed Dataport 1D and 2D Surfaces:

This field must be set to the same value as the Depth field.

#### For Other Surfaces:

This field is ignored.

### 6 Multisampled Surface Storage Format

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'
------------	-------------------------------------

This field indicates the storage format of the multisampled surface.

Value	Name	Description	Project
0h	MSS	Multisampled surface was/is rendered as a render target	All
1h	DEPTH_STENCIL	Multisampled surface was rendered as a depth or stencil buffer	All

#### Programming Notes

- All multisampled render target surfaces must have this field set to MSFMT\_MSS
- IF this field is MSFMT\_DEPTH\_STENCIL, the only sampling engine messages allowed are "ld2dms", "resinfo", and "sampleinfo".
- This field is ignored if **Number of Multisamples** is MULTISAMPLECOUNT\_1

### 5:3 Number of Multisamples

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'
------------	-------------------------------------

## RENDER\_SURFACE\_STATE

## RENDER\_SURFACE\_STATE

- For surfaces accessed with the *Data Port Media Block Read/Write* message, the pixel size is assumed to be 32 bits in width.
- For surfaces accessed with the **Data Port Transpose Read message**, the pixel size is assumed to be 32 bits in width.
- For **Surface Format** with other than 8, 16, 32, 64, or 128 bits per pixel, this field must be zero.
- If **Render Target Rotation** is set to other than RTROTATE\_0DEG, this field must be zero.
- If **Surface Type** not SURFTYPE\_2D, this field must be zero.
- If **MIP Count** is not zero, this field must be zero.
- If **Number of Multisamples** is not MULTISAMPLECOUNT\_1, this field must be zero.
- If **Surface Array** is enabled, this field must be zero.
- If **Auxiliary Surface Mode** is not AUX\_NONE, this field must be zero.
- If **Surface Vertical Alignment** is VALIGN\_8, this field must be a multiple of 8.
- For **Surface Format** with 8 bits per element, this field must be a multiple of 16.
- For **Surface Format** with 16 bits per element, this field must be a multiple of 8.

This field must be zero if Surface Format is PLANAR\*.

CHV,  
BSW

If sampling an ASTC surface with block size of 5X5 or 5X4 and  $0 < [(max(Surface\_Width \gg 1, 1) \% 10] < 6$ , and accessing LOD=2 or higher, then this field must be programmed to 4 pixels.

CHV,  
BSW

24 **Reserved**

Format:	MBZ
---------	-----

23:21 **Y Offset**

Format:	RowOffset[4:2]
---------	----------------

This field specifies the vertical offset in rows from the **Surface Base Address** to the start of the surface. (See additional description in the **X Offset** field.)

Value	Name	Description
[0,28]		In multiples of 4 (low two bits missing)

### Programming Notes

- For linear surfaces, this field must be zero.
- For render targets in which the **Render Target Array Index** is not zero, this field must be zero.
- For **Surface Format** with other than 8, 16, 32, 64, or 128 bits per pixel, this field must be zero.
- If **Render Target Rotation** is set to other than RTROTATE\_0DEG, this field must be zero.

## Render Target Message Header Control

<b>MHC_RT_C0 - Render Target Message Header Control</b>						
<b>DWord</b>	<b>Bit</b>	<b>Description</b>				
0	31	<b>Reserved</b>				
		Project:	All			
	30:27	Format:	Ignore			
		Ignored				
26:16	30:27	<b>Viewport Index</b>				
		Project:	All			
	26:16	Format:	U4			
		For Render Target Write message, specifies the index of the viewport currently being used. Range = [0,15] Ignored by Render Target Read message.				
15	26:16	<b>Render Target Array Index</b>				
		Project:	All			
	15	Format:	U11			
		Specifies the array index to be used for the following surface types: SURFTYPE_1D: specifies the array index. Range = [0,511] SURFTYPE_2D: specifies the array index. Range = [0,511] SURFTYPE_3D: specifies the Z or R coordinate. Range = [0,2047] SURFTYPE_BUFFER: must be zero. SURFTYPE_CUBE: specifies the face identifier. Mapping (0,+x) (1,-x) (2,+y) (3,-y) (4,+z) (5,-z).				
<b>Programming Notes</b>						
The Render Target Array Index used by hardware for access to the Render Target is overridden with the Minimum Array Element defined in SURFACE_STATE if it is out of the range between Minimum Array Element and Depth. For cube surfaces, a depth value of 5 is used for this determination.						
<b>Front/Back Facing Polygon</b>						
15	15	Project:	All			
		Format:	U1			
Determines whether the polygon is front or back facing. Used by the render cache to determine which stencil test state to use.						
<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>			
0h	Front facing	All	All			
1h	Back facing	All	All			

## MHC\_RT\_C0 - Render Target Message Header Control

## SAMPLER\_BORDER\_COLOR\_STATE

<b>SAMPLER_BORDER_COLOR_STATE</b>						
Project:	Pre-CHV, BSW					
Source:	PRM					
Size (in bits):	128					
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000					
<b>Programming Notes</b>						
<ul style="list-style-type: none"> <li>DX9 mode: The border color is 8-bit UNORM format, regardless of the surface format chosen. For surface formats with one or more channels missing (i.e. R5G6R5_UNORM is missing the alpha channel), the value from the border color, if selected, will be used even for the missing channels.</li> <li>DX10/OGL mode: the format of the border color depends on the format of the surface being sampled. If the map format is UINT, then the border color format is R32G32B32A32_UINT. If the map format is SINT, then the border color format is R32G32B32A32_SINT. Otherwise, the border color format is R32G32B32A32_FLOAT. For surface formats with one or more channels missing, the value from the border color is not used for the missing channels, resulting in these channels resulting in the overall default value (0 for colors and 1 for alpha) regardless of whether border color is chosen. The surface formats with "L" and "I" have special behavior with respect to the border color. The border color value used for the replicated channels (RGB for "L" formats and RGBA for "I" formats) comes from the red channel of border color. In these cases, the green and blue channels, and also alpha for "I", of the border color are ignored. The format of this state depends on the Texture Border Color Mode field.</li> </ul>	CHV, BSW					
DWord	Bit	Description				
0	31:24	<b>Border Color Alpha</b> <table border="1"> <tr> <td>Exists If:</td><td>Structure[SAMPLER_STATE][Texture Border Color Mode] == 'DX9'</td></tr> <tr> <td>Format:</td><td>UNORM8</td></tr> </table>	Exists If:	Structure[SAMPLER_STATE][Texture Border Color Mode] == 'DX9'	Format:	UNORM8

## SAMPLER\_INDIRECT\_STATE\_BORDER\_COLOR

<b>SAMPLER_INDIRECT_STATE_BORDER_COLOR</b>	
Project:	CHV, BSW
Source:	PRM
Size (in bits):	128
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000
<p>This structure is a one version of the SAMPLER_INDIRECT_STATE structure, suitable for many needs. An instance of this structure is pointed to by the <b>Indirect State Pointer</b> field in SAMPLER_STATE. The interpretation of the border color depends on the <b>Texture Border Color Mode</b> field in SAMPLER_STATE as follows:</p> <ul style="list-style-type: none"> <li>In <b>DX9</b> mode, the border color is 8-bit UNORM format, regardless of the surface format chosen. For surface formats with one or more channels missing (i.e. R5G6R5_UNORM is missing the alpha channel), the value from the border color, if selected, will be used even for the missing channels.</li> <li>In <b>DX10/OGL</b> mode, the format of the border color is R32G32B32A32_FLOAT, R32G32B32A32_SINT, or R32G32B32A32_UINT, depending on the surface format chosen. For surface formats with one or more channels missing, the value from the border color is not used for the missing channels, resulting in these channels resulting in the overall default value (0 for colors and 1 for alpha) regardless of whether border color is chosen. The surface formats with "L" and "I" have special behavior with respect to the border color. The border color value used for the replicated channels (RGB for "L" formats and RGBA for "I" formats) comes from the red channel of border color. In these cases, the green and blue channels, and also alpha for "I", of the border color are ignored.</li> </ul>	

<b>Programming Notes</b>	
<ul style="list-style-type: none"> <li>DX9 mode is not supported for surfaces with more than 16 bits in any channel, other than 32-bit float formats which are supported.</li> <li>The conditions under which this color is used depend on the <b>Surface Type</b> - 1D/2D/3D surfaces use the border color when the coordinates extend beyond the surface extent; cube surfaces use the border color for "empty" (disabled) faces.</li> <li>The border color itself is accessed through the texture cache hierarchy rather than the state cache hierarchy. Thus, if the border color is changed in memory, the texture cache must be invalidated and the state cache does not need to be invalidated.</li> <li>MAPFILTER_MONO: The border color is ignored. Border color is fixed at a value of 0 by hardware.</li> </ul>

## SAMPLER\_INDIRECT\_STATE

### SAMPLER\_INDIRECT\_STATE

Project:	CHV, BSW
Source:	PRM
Size (in bits):	512
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

Note: There are three variations of this structure, defined separately because their payloads have different lengths. Currently only SAMPLER\_INDIRECT\_STATE\_BORDER\_COLOR is fully defined.

This structure is pointed to by **Indirect State Pointer** (SAMPLER\_STATE).

The interpretation of the border color depends on the **Texture Border Color Mode** field in SAMPLER\_STATE as follows:

- In **DX9** mode, the border color is 8-bit UNORM format, regardless of the surface format chosen. For surface formats with one or more channels missing (i.e. R5G6R5\_UNORM is missing the alpha channel), the value from the border color, if selected, will be used *even for the missing channels*.
- In **DX10/OGL** mode, the format of the border color is R32G32B32A32\_FLOAT, R32G32B32A32\_SINT, or R32G32B32A32\_UINT, depending on the surface format chosen. For surface formats with one or more channels missing, the value from the border color is not used for the missing channels, resulting in these channels resulting in the overall default value (0 for colors and 1 for alpha) regardless of whether border color is chosen. The surface formats with "L" and "I" have special behavior with respect to the border color. The border color value used for the replicated channels (RGB for "L" formats and RGBA for "I" formats) comes from the *red* channel of border color. In these cases, the green and blue channels, and also alpha for "I", of the border color are ignored.

The format of this state depends on the **Texture Border Color Mode** field.

#### Programming Notes

- DX9 mode is not supported for surfaces with more than 16 bits in any channel, other than 32-bit float formats which are supported.
- The conditions under which this color is used depend on the **Surface Type** - 1D/2D/3D surfaces use the border color when the coordinates extend beyond the surface extent; cube surfaces use the border color for "empty" (disabled) faces.
- The border color itself is accessed through the texture cache hierarchy rather than the state cache hierarchy. Thus, if the border color is changed in memory, the texture cache must be invalidated and the state cache does not need to be invalidated.
- MAPFILTER\_MONO: The border color is ignored. Border color is fixed at a value of 0 by hardware.

Value	Name	Description												
00b		4-tap filter is only done on all channels.												
01b		Enable 8-tap Adaptive filter on G-channel. 4-tap filter on other channels.												
10b		8-tap filter is done on all channels (UV-ch uses the Y-coefficients)												

## SAMPLER\_STATE\_8x8\_AVs

		11b	Enable 8-tap Adaptive filter all channels (UV-ch uses the Y-coefficients).	
<b>Programming Notes</b>				
For 00 and 10, are applicable for RGB surfaces only or surface without Y-ch. In case it is a YUV surface it will default to adaptive mode automatically which is 01 and 11 respectively. Alpha channel is always bi-linear filter irrespective of the above modes.				
Mode 01 and 00 are legacy support and are supported on all surface formats.				
When Mode is 10 and Surface format is Y8_UNORM, Bypass X/Y Adaptive Filtering must be 1, and Default Sharp Level must be 255

## SAMPLER\_STATE

<b>SAMPLER_STATE</b>			
Project: CHV, BSW Source: PRM Exists If: //MessageType != 'Deinterlace' && (MessageType != 'Sample_8x8') Size (in bits): 128 Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000			
<p>This is the normal sampler state used by all messages that use SAMPLER_STATE except sample_8x8 and deinterlace. The sampler state is stored as an array of up to 16 elements, each of which contains the dwells described here. The start of each element is spaced 4 dwells apart. The first element of the sampler state array is aligned to a 32-byte boundary.</p>			
DWord	Bit	Description	
0	31	<b>Sampler Disable</b>	
		Project:	All
	30	Format:	Disable
		This field allows the sampler to be disabled. If disabled, all output channels will return 0.	
	29	<b>Reserved</b>	
	Project:	CHV, BSW	
	<b>Texture Border Color Mode</b>		
	For some surface formats, the 32 bit border color is decoded differently based on the border color mode. In addition, the default value of channels not included in the surface may be affected by this field. Refer to the "Sampler Output Channel Mapping" table for the values of these channels, and for surface formats that may only support one of these modes. Also refer to the definition of SAMPLER_BORDER_COLOR_STATE for more details on the behavior of the two modes defined by this field.		
Value	Name	Description	
0h	DX10/OGL	DX10/OGL mode for interpreting the border color	
1h	DX9	DX9 and earlier mode for interpreting the border color	
<b>Programming Notes</b>			Project
This field is required to be the same for every message over a period of time. A flush of the sampler cache must occur before a message with the opposite state of this field is delivered.			
This field must be set to DX9 mode when used with surfaces that have Surface Format P4A4_UNORM or A4P4_UNORM.			
This field must be set to DX10/OGL mode when used with surfaces that have Surface Format YCRCB_SWAPUV or YCRCB_SWAPY.			
This field must be set to DX10/OGL mode if <b>Surface Format</b> for the associated			CHV,

## SAMPLER\_STATE

		surface is UINT OR SINT.	BSW																				
		This field must be set to DX10/OGL mode if REDUCTION_MINIMUM or REDUCTION_MAXIMUM or message type is sample_min or sample_max.																					
28:27	<b>LOD PreClamp Mode</b>																						
	Project: CHV, BSW																						
	This field determines whether the computed LOD is clamped to [max,min] mip level before the mag-vs-min determination is performed.  PRECLAMP_OGL: LOD pre-clamped to <b>Min LOD</b> and <b>Max LOD</b>  OpenGL API currently clamps LOD to the <b>Min LOD</b> and <b>Max LOD</b> (from Sampler State) prior to performing min/mag determination, and therefore it is expected that an OpenGL driver would need to set this field to PRECLAMP_OGL.																						
	<table border="1"> <thead> <tr> <th>Value</th><th>Name</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0h</td><td>NONE</td><td>LOD PreClamp disabled</td></tr> <tr> <td>1h</td><td>Reserved</td><td></td></tr> <tr> <td>2h</td><td>OGL</td><td>LOD PreClamp enabled (OGL mode)</td></tr> </tbody> </table>			Value	Name	Description	0h	NONE	LOD PreClamp disabled	1h	Reserved		2h	OGL	LOD PreClamp enabled (OGL mode)

13:1		<b>Texture LOD Bias</b>																													
		<table border="1"> <tr> <td>Project:</td><td>All</td></tr> <tr> <td>Format:</td><td>S4.8 2's complement</td></tr> </table>		Project:	All	Format:	S4.8 2's complement																								
Project:	All																														
Format:	S4.8 2's complement																														
Range: [-16.0, 16.0)																															
This field specifies the signed bias value added to the calculated texture map LOD prior to min-vs-mag determination and mip-level clamping. Assuming mipmaping is enabled, a positive LOD bias will result in a somewhat blurrier image (using less-detailed mip levels) and possibly higher performance, while a negative bias will result in a somewhat crisper image (using more-detailed mip levels) and may lower performance.																															
<table border="1"> <tr> <th colspan="3"><b>Programming Notes</b></th><th>Project</th></tr> <tr> <td colspan="3">There is no requirement or need to offset the LOD Bias in order to produce a correct LOD for texture filtering (as was required for correct bilinear and anisotropic filtering in some legacy devices).</td><td></td></tr> </table>				<b>Programming Notes</b>			Project	There is no requirement or need to offset the LOD Bias in order to produce a correct LOD for texture filtering (as was required for correct bilinear and anisotropic filtering in some legacy devices).																							
<b>Programming Notes</b>			Project																												
There is no requirement or need to offset the LOD Bias in order to produce a correct LOD for texture filtering (as was required for correct bilinear and anisotropic filtering in some legacy devices).

<b>SAMPLER_STATE</b>						
		Format:	U1 Enumerated Type			
Controls which algorithm is used for anisotropic filtering. Generally, the EWA approximation algorithm results in higher image quality than the legacy algorithm.						
		Value	Name	Description		
		0h	LEGACY	Use the legacy algorithm for anisotropic filtering		
		1h	EWA Approximation	Use the new EWA approximation algorithm for anisotropic filtering		
1	31:20	<b>Min LOD</b>				
		Project:	All			
		Format:	U4.8 in LOD units			
		Range: [0.0, 14.0], where the upper limit is also bounded by the Max LOD.				
		This field specifies the minimum value used to clamp the computed LOD after LOD bias is applied. Note that the minification-vs.-magnification status is determined after LOD bias and before this maximum (resolution) mip clamping is applied. The integer bits of this field are used to control the "maximum" (highest resolution) mipmap level that may be accessed (where LOD 0 is the highest resolution map). The fractional bits of this value effectively clamp the inter-level trilinear blend factor when trilinear filtering is in use.				
		<b>Programming Notes</b>				
		If Min LOD is greater than Max LOD, Min LOD takes precedence, i.e. the resulting LOD will always be Min LOD.				
		This field must be zero if the Min or Mag Mode Filter is set to MAPFILTER_MONO				
	19:8	<b>Max LOD</b>				
		Project:	All			
		Format:	U4.8 in LOD units			
		Range: [0.0, 14.0]				
		This field specifies the maximum value used to clamp the computed LOD after LOD bias is applied. Note that the minification-vs.-magnification status is determined after LOD bias and before this minimum (resolution) mip clamping is applied. The integer bits of this field are used to control the "minimum" (lowest resolution) mipmap level that may be accessed. The fractional bits of this value effectively clamp the inter-level trilinear blend factor when trilinear filtering is in use. Force the mip map access to be between the mipmap specified by the integer bits of the Min LOD and the ceiling of the value specified here.				
	7	<b>ChromaKey Enable</b>				
		Project:	CHV, BSW			
		Format:	Enable This field enables the chroma key function.			
		<b>Programming Notes</b>				

## **SAMPLER\_STATE**

		Supported only on a specific subset of surface formats. See section titled: "Surface Formats" in this volume for supported formats. 18	<b>U Address Mag Filter Rounding Enable</b>	Project:	All		
		Format:	Enable		
		Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.			
		<b>Programming Notes</b>		<b>Project</b>	
		Hardware will <b>not</b> force rounding enable.		CHV, BSW	
17	<b>U Address Min Filter Rounding Enable</b>	Project:	All		
		Format:	Enable		
		Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.			
		<b>Programming Notes</b>		<b>Project</b>	
		Hardware will <b>not</b> force rounding enable.		CHV, BSW	
16	<b>V Address Mag Filter Rounding Enable</b>	Project:	All		
		Format:	Enable		
		Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.			
		<b>Programming Notes</b>		<b>Project</b>	
		Hardware will <b>not</b> force rounding enable.		CHV, BSW	
15	<b>V Address Min Filter Rounding Enable</b>	Project:	All		
		Format:	Enable		
		Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.			

## SAMPLER\_STATE

		<b>Programming Notes</b>		<b>Project</b>
		Hardware will <b>not</b> force rounding enable.		CHV, BSW
14	<b>R Address Mag Filter Rounding Enable</b>	Project: All Format: Enable		Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.
		<b>Programming Notes</b>		<b>Project</b>
		Hardware will <b>not</b> force rounding enable.		CHV, BSW
13	<b>R Address Min Filter Rounding Enable</b>	Project: All Format: Enable		Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.
		<b>Programming Notes</b>		<b>Project</b>
		Hardware will <b>not</b> force rounding enable.		CHV, BSW
12:11	<b>Trilinear Filter Quality</b>	Project: All Format: U2 Enumerated Type		Selects the quality level for the trilinear filter.
<b>Value</b>	<b>Name</b>	<b>Description</b>		<b>Project</b>
0	FULL	Full Quality. Both mip maps are sampled under all circumstances.		All
1	HIGH	High Quality. Same as full quality.		CHV, BSW
2	MED	Medium Quality. If the contribution of one mip map is less than 25%, only the other mip map contributes.		All
3	LOW	Low Quality. If the contribution of one mip map is less than 37.5%, only the other mip map contributes.		All
10	<b>Non-normalized Coordinate Enable</b>	Project: CHV, BSW Format: Enable		This field, if enabled, specifies that the input coordinates (U/V/R) are in non-normalized space, where each integer increment is one texel on LOD 0. If disabled, coordinates are normalized, where the range 0 to 1 spans the entire surface.
		<b>Programming Notes</b>		
		The following state must be set as indicated if this field is <i>enabled</i> :		

## SAMPLER\_STATE

- TCX/Y/Z Address Control Mode must be TEXCOORDMODE\_CLAMP, TEXCOORDMODE\_HALF\_BORDER, or TEXCOORDMODE\_CLAMP\_BORDER.
- Surface Type must be SURFTYPE\_2D or SURFTYPE\_3D.
- Mag Mode Filter must be MAPFILTER\_NEAREST or MAPFILTER\_LINEAR.
- Min Mode Filter must be MAPFILTER\_NEAREST or MAPFILTER\_LINEAR.
- Mip Mode Filter must be MIPFILTER\_NONE.
- Min LOD must be 0.
- Max LOD must be 0.
- MIP Count must be 0.
- Surface Min LOD must be 0.
- Texture LOD Bias must be 0.

### 9 Reserved

Project:	CHV, BSW
Format:	MBZ

### 8:6 TCX Address Control Mode

Project:	All
Format:	Texture Coordinate Mode [CHV, BSW] Enumerated Type

Controls how the 1st (TCX, aka U) component of input texture coordinates are mapped to texture map addresses - specifically, how coordinates "outside" the texture are handled (wrap/clamp/mirror). The setting of this field is subject to being overridden by the Cube Surface Control Mode field when sampling from a SURFTYPE\_CUBE surface.

Programming Notes	Project
When using cube map texture coordinates, each TC component must have the same Address Control Mode.	CHV, BSW
When TEXCOORDMODE_CUBE is not used accessing a cube map, the map's Cube Face Enable field must be programmed to 111111b (all faces enabled).	
MAPFILTER_MONO: Texture addressing modes must all be set to TEXCOORDMODE_CLAMP_BORDER. The <b>Border Color</b> is ignored in this mode, a constant value of 0 is used for border color. Software must pad the border texels within the map itself with 0.	
If <b>Surface Format</b> is PLANAR*, this field must be set to TEXCOORDMODE_CLAMP.	

### 5:3 TCY Address Control Mode

Project:	All
Format:	Texture Coordinate Mode [CHV, BSW] Enumerated Type

Controls how the 2nd (TCY, aka V) component of input texture coordinates are mapped to texture map addresses - specifically, how coordinates "outside" the texture are handled (wrap/clamp/mirror). See Address TCX Control Mode above for details

### Programming Notes

## SAMPLER\_STATE

		If this field is set to TEXCOORDMODE_CLAMP_BORDER or TEXCOORDMODE_HALF_BORDER and a 1D surface is sampled, incorrect blending with the border color in the vertical direction may occur.
2:0	<b>TCZ Address Control Mode</b>	
	Project:	All
	Format:	Texture Coordinate Mode [CHV, BSW] Enumerated Type
	<b>Description</b>	<b>Project</b>
	Controls how the 3rd (TCZ) component of input texture coordinates are mapped to texture map addresses - specifically, how coordinates "outside" the texture are handled (wrap/clamp/mirror). See Address TCX Control Mode above for details	
	If this field is set to TEXCOORDMODE_CLAMP_BORDER or TEXCOORDMODE_HALF_BORDER and a 3D surface is sampled, incorrect blending with the border color in the Q direction may occur.	CHV, BSW

Format:	MHC_PSM					
Specifies the 16-bit Pixel/Sample Mask used with SIMD16 and SIMD8 surfaces.						

## Slot Group 2 Message Descriptor Control Field

### MDC\_SG2 - Slot Group 2 Message Descriptor Control Field

Project: CHV, BSW  
Source: PRM  
Size (in bits): 1  
Default Value: 0x00000000

DWord	Bit	Description		
0	0	<b>SIMD Mode</b>		
		Project:	All	
		Format:	Enumeration	
		Controls which 8 bits of Pixel/Sample Mask in the message header are ANDed with the execution mask to determine which slots are accessed. This field is ignored if the header is not present.		
Value	Name	Description	Project	
00h	SG8L	Use low 8 slots	All	
01h	SG8U	Use high 8 slots	All	

## Slot Group 3 Message Descriptor Control Field

<b>MDC_SG3 - Slot Group 3 Message Descriptor Control Field</b>				
<b>DWord</b>	<b>Bit</b>	<b>Description</b>		
0	1:0	<b>SIMD Mode</b>		
		Format:	Enumeration	
		Controls which 8 bits of Pixel/Sample Mask in the message header are ANDed with the execution mask to determine which slots are accessed. This field is ignored if the header is not present.		
<b>Value</b>		<b>Name</b>	<b>Description</b>	<b>Project</b>
00h		SG4x2	SIMD4x2	
01h		SG8L	Use low 8 slots	
02h		SG8U	Use high 8 slots	
03h		Reserved	Ignored	

## Slot Group Select Render Cache Message Descriptor Control Field

### MDC\_RT\_SGS - Slot Group Select Render Cache Message Descriptor Control Field

Project: CHV, BSW

Source: PRM

Size (in bits): 1

Default Value: 0x00000000

DWord	Bit	Description	
0	0	<b>Slot Group Select</b>	
		Project:	All
		This field selects whether slots 15:0 or slots 31:16 are used for bypassed data. Bypassed data includes the antialias alpha, multisample coverage mask, and if the header is not present also includes the X/Y addresses and pixel enables. For 8- and 16-pixel dispatches, SLOTGRP_LO must be selected on every message. For 32-pixel dispatches, this field must be set correctly for each message based on which slots are currently being processed.	
Value	Name	Description	Project
00h	SLOTGRP_LO	Choose bypassed data for slots 15:0	All
01h	SLOTGRP_HI	Choose bypassed data for slots 31:16	All

## SO\_DECL

<b>SO_DECL</b>								
Project: CHV, BSW Source: RenderCS Size (in bits): 16 Default Value: 0x00000000								
A list of SO_DECL structures are passed in the 3DSTATE_SO_DECL_LIST command. Each structure specifies either (a) the source and destination of an up-to-4-DWord appending write into an SO buffer, or (b) how many DWords to skip over in the destination SO buffer (i.e., a "hole" where the previous buffer contents are maintained).								
DWord	Bit	Description						
0	15:14	<b>Reserved</b>						
		Project:	All					
13:12	<b>Output Buffer Slot</b>		Format: MBZ					
		Project:	All					
11	<b>Format:</b> U2 Buffer Index		This field selects the destination output buffer slot.					
		<b>Hole Flag</b>						
10	Project:		All					
		Format:	Flag					
If set, the Component Mask field indirectly specifies a number of 32-bit locations to skip over (leave unmodified in memory) in the selected output buffer. The Register Index field is ignored. The only permitted Component Mask values are as follows:								
<table border="1"> <tr><td>0x0 No Dwords are skipped over (SO_DECL performs no operation)</td></tr> <tr><td>0x1 (X) Skip 1 DWord</td></tr> <tr><td>0x3 (XY) Skip 2 DWords</td></tr> <tr><td>0x7 (XYZ) Skip 3 DWords</td></tr> <tr><td>0xF (XYZW) Skip 4 DWords</td></tr> </table>				0x0 No Dwords are skipped over (SO_DECL performs no operation)	0x1 (X) Skip 1 DWord	0x3 (XY) Skip 2 DWords	0x7 (XYZ) Skip 3 DWords	0xF (XYZW) Skip 4 DWords
0x0 No Dwords are skipped over (SO_DECL performs no operation)								
0x1 (X) Skip 1 DWord								
0x3 (XY) Skip 2 DWords								
0x7 (XYZ) Skip 3 DWords								
0xF (XYZW) Skip 4 DWords								
9:4	<b>Reserved</b>							
	Project:	All						
	Format:	MBZ						
	<b>Register Index</b>							
	Project:	All						
	Format:	U6 128-bit granular offset into the source vertex read data						

## **SO\_DECL**

If Hole Flag is clear, this field specifies the 128-bit offset into the source vertex data which supplies the source data to be written to the destination buffer, where the individual 32-component destination locations are selected by Component Mask. e.g., Register Index 0 corresponds with the first 128 bits of the data read from the vertex URB entry (as per corresponding Vertex Read Offset state)

There is only enough internal storage for the 128-bit vertex header and 32 128-bit vertex attributes.

<b>Value</b>	<b>Name</b>
[0,32]	
0h	<b>[Default]</b>

### **Programming Notes**

It is the responsibility of software to map any API-visible source data specifications (e.g., vertex register number) into 128-bit granular URB read offsets.

**3:0 Component Mask**

Project:	All
Format:	MASK 4-bit Mask

This field is a 4-bit bitmask that selects which contiguous 32-bit component(s) are either written or skipped-over in the destination buffer. If this field is zero the SO\_DECL operation is effectively a no-op. No data will be appended to the destination and the destination buffer's write pointer will not be advanced. If the **Hole Flag** is set, this field (if non-zero) indirectly specifies how much the destination buffer's write pointer should be advanced. See **Hole Flag** description above for restrictions on this field. If the **Hole Flag** is clear, this field (if non-zero) selects which source components are to be written to the destination buffer. The components must be contiguous, e.g. YZW is legal, but XZW is not. The selected source components are written to the destination buffer starting at the current write pointer, and then the write pointer is advanced past the written data. E.g., if YZW is specified, the three (YZW) components of the source register will be written to the destination buffer at the current write pointer, and the write pointer will be advanced by 3 DWords.

## SrcRegNum

<b>SrcRegNum</b>									
Project: CHV, BSW Source: Eulsa Size (in bits): 8 Default Value: 0x00000000									
<b>Description</b>		<b>Project</b>							
Register Number The register number for the operand. For a GRF register, is the part of a register address that aligns to a 256-bit (32-byte) boundary. For an ARF register, this field is encoded such that MSBs identify the architecture register type and LSBs provide the register number. An ARF register can only be dst or src0. Any src1 or src2 operands cannot be ARF registers. RegNum and SubRegNum together provide the byte-aligned address for the origin of a register region. RegNum provides bits 12:5 of that address. For one-source and two-source instructions, SubregNum provides bits 4:0. For three-source instructions, the address must be DWord-aligned; SubRegNum provides bits 4:2 of the address and bits 1:0 are zero. This field is present for the direct addressing mode and not present for indirect addressing. This field applies to both source and destination operands.		CHV, BSW							
<b>DWord</b>	<b>Bit</b>	<b>Description</b>

<b>Value</b>	<b>Name</b>	<b>Description</b>							
0-127	If {Dst/Src0/Src1/Src2}.RegFile==GRF								
0-Offh	If {Dst/Src0/Src1/Src2}.RegFile==ARF	This field is used to encode the architecture register as well as providing the register number. See GEN Execution Environment chapter for details.							

## SrcSubRegNum

<b>SrcSubRegNum</b>			
Project: CHV, BSW Source: Eulsa Size (in bits): 5 Default Value: 0x00000000			
<b>Description</b>			
	<p>Subregister Number The subregister number for the operand. For a GRF register, is the byte address within a 256-bit (32-byte) register. For an ARF register, determines the sub-register number according to the specified encoding for the given architecture register. RegNum and SubRegNum together provide the byte-aligned address for the origin of a GRF register region. RegNum provides bits 12:5 of that address. For one-source and two-source instructions, SubregNum provides bits 4:0. For three-source instructions, the address must be DWord-aligned; SubRegNum provides bits 4:2 of the address and bits 1:0 are zero.</p>		
<b>Programming Notes</b>			
<p>Note: The recommended instruction syntax uses subregister numbers within the GRF in units of actual data element size, corresponding to the data type used. For example for the F (Float) type, the assembler syntax uses subregister numbers 0 to 7, corresponding to subregister byte addresses of 0 to 28 in steps of 4, the element size.</p>			
DWord	Bit	<b>Description</b>	
0	4:0	<b>Source Sub Register Number</b>	
Value	Name	<b>Description</b>	
0-31	If {Dst/Src0/Src1/Src2}.RegFile==GRF		
0-0ffh	If {Dst/Src0/Src1/Src2}.RegFile==ARF	This field is used to encode the architecture register as well as providing the register number. See GEN Execution Environment chapter for details.	

## Stateless Binding Table Index Message Descriptor Control Field

### MDC\_STATELESS - Stateless Binding Table Index Message Descriptor Control Field

Project: CHV, BSW

Source: PRM

Size (in bits): 8

Default Value: 0x000000FF

DWord	Bit	Description		
0	7:0	<b>Binding Table Index</b>		
		Project:	All	
		Format:	Enumeration	
Specifies the message is Stateless				
Value	Name	Description	Project	
0FFh	A32_A64 <b>[Default]</b>	Specifies a A32 or A64 Stateless access that is locally coherent (coherent within a thread group)	All	
0FDh	A32_A64_NC	Specifies a A32 or A64 Stateless access that is non-coherent (coherent within a thread).	All	
Others	Reserved	Ignored	All	
<b>Restriction</b>				
When using A32_A64_NC, SW must ensure that 2 threads do not both access the same cache line (64B)				

## Stateless Block Message Header

<b>MH_A32_GO - Stateless Block Message Header</b>			
<b>DWord</b>	<b>Bit</b>	<b>Description</b>	
0-1	63:0	<b>Reserved</b>	
		Project:	All
		Format:	Ignore
		Ignored	
2	31:0	<b>Global Offset</b>	
		Project:	All
		Format:	U32
		Specifies the global element index into the buffer, in units of Owords, Dwords, or Bytes (depending on the message).	
3	31:0	<b>Per Thread Scratch Space</b>	
		Project:	All
		Format:	MHC_PTSS [CHV, BSW]
		Specifies amount of scratch space used by this thread, for Stateless bounds checking.	
4	31:0	<b>Reserved</b>	
		Project:	All
		Format:	Ignore
		Ignored	
5	31:0	<b>Buffer Base Address</b>	
		Project:	All
		Format:	MHC_A32_BBA [CHV, BSW]
		Specifies the surface address offset page [31:10] for A32 stateless messages.	
6-7	63:0	<b>Reserved</b>	
		Project:	All

## MH\_A32\_GO - Stateless Block Message Header

Format:	Ignore
Ignored	

## Stateless Surface Message Header

MH1_A32 - Stateless Surface Message Header

Format:	Ignore					

## Stateless Surface Pixel Mask Message Header

### MH1\_A32\_PSM - Stateless Surface Pixel Mask Message Header

Project:	CHV, BSW
Source:	DataPort 1
Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x0000FFFF

DWord	Bit	Description				
0-4	159:0	<p><b>Reserved</b></p> <table border="1"> <tr> <td>Format:</td> <td>Ignore</td> </tr> </table> <p>Ignored</p>	Format:	Ignore		
Format:	Ignore					
5	31:0	<p><b>Buffer Base Address</b></p> <table border="1"> <tr> <td>Format:</td> <td>MHC_A32_BBA [CHV, BSW]</td> </tr> </table> <p>Specifies the surface address offset page [31:10] for A32 stateless messages.</p>	Format:	MHC_A32_BBA [CHV, BSW]		
Format:	MHC_A32_BBA [CHV, BSW]					
6	31:0	<p><b>Reserved</b></p> <table border="1"> <tr> <td>Format:</td> <td>Ignore</td> </tr> </table> <p>Ignored</p>	Format:	Ignore		
Format:	Ignore					
7	31:0	<p><b>Pixel Sample Mask</b></p> <table border="1"> <tr> <td>Project:</td> <td></td> </tr> <tr> <td>Format:</td> <td>MHC_PSM</td> </tr> </table> <p>Specifies the 16-bit Pixel/Sample Mask used with SIMD16 and SIMD8 surfaces.</p>	Project:		Format:	MHC_PSM
Project:						
Format:	MHC_PSM					

## Subset Atomic Integer Trinary Operation Message Descriptor Control Field

<b>MDC_AOP3S - Subset Atomic Integer Trinary Operation Message Descriptor Control Field</b>			
<b>DWord</b>	<b>Bit</b>	<b>Description</b>	
0	3:0	<b>Atomic Integer Operation Type</b>	
		Project:	All
		Format:	Enumeration
		Specifies the atomic integer trinary operation to be performed	
Value	Name	Description	Project
0Eh	AOP_CMPWR <b>[Default]</b>	new_dst = (src0 == old_dst) ? src1 : old_dst	All
Others	Reserved	Ignored	All
<b>Programming Notes</b>			
When Return Data Control is set, old_dst is returned.			

## Subset Reversed SIMD Mode 2 Message Descriptor Control Field

### MDC\_SM2RS - Subset Reversed SIMD Mode 2 Message Descriptor Control Field

Project: CHV, BSW  
Source: PRM  
Size (in bits): 1  
Default Value: 0x00000001

DWord	Bit	Description			
0	0	<b>SIMD Mode</b>			
		Project:	All		
		Format:	Enumeration		
Specifies the SIMD mode of the message (number of slots processed)					
Value	Name	Description	Project		
0h	Reserved	Not used	All		
01h	SIMD8 <b>[Default]</b>	SIMD8	All		

## Subset SIMD Mode 2 Message Descriptor Control Field

### MDC\_SM2S - Subset SIMD Mode 2 Message Descriptor Control Field

Project: CHV, BSW  
 Source: PRM  
 Size (in bits): 1  
 Default Value: 0x00000000

DWord	Bit	Description			
0	0	<b>SIMD Mode</b>			
		Project:	All		
		Format:	Enumeration		
Specifies the SIMD mode of the message (number of slots processed)					
Value	Name	Description	Project		
00h	SIMD8	SIMD8	All		
01h	Reserved	Ignored	All		

## Subset SIMD Mode 3 Message Descriptor Control Field

### MDC\_SM3S - Subset SIMD Mode 3 Message Descriptor Control Field

Project: CHV, BSW  
Source: PRM  
Size (in bits): 2  
Default Value: 0x00000000

DWord	Bit	Description			
0	1:0	<b>SIMD Mode</b>			
		Project:	All		
		Format:	Enumeration		
Specifies the SIMD mode of the message (number of slots processed)					
Value	Name	Description	Project		
00h	SIMD4x2	SIMD4x2			
01h	Reserved	Ignored			
02h	SIMD8	SIMD8			
03h	Reserved	Ignored			

## Subspan Render Target Message Header Control

<b>MHC_RT_SUBSPAN - Subspan Render Target Message Header Control</b>				
<b>DWord</b>	<b>Bit</b>	<b>Description</b>		
0	31:16	<b>Y</b>		
		<table border="1"> <tr> <td>Project:</td><td>All</td></tr> <tr> <td>Format:</td><td>U16</td></tr> </table> Y coordinate for upper-left pixel of this subspan	Project:	All
Project:	All			
Format:	U16			
	15:0	<b>X</b>		
		<table border="1"> <tr> <td>Project:</td><td>All</td></tr> <tr> <td>Format:</td><td>U16</td></tr> </table> X coordinate for upper-left pixel of this subspan	Project:	All
Project:	All			
Format:	U16			

## Surface Binding Table Index Message Descriptor Control Field

### MDC\_BTS - Surface Binding Table Index Message Descriptor Control Field

Project: CHV, BSW  
Source: PRM  
Size (in bits): 8  
Default Value: 0x00000000

DWord	Bit	Description			
0	7:0	<b>Binding Table Index</b>			
		Project:	All		
		Format:	Enumeration		
Specifies the Binding Table index for the message, which must be a Surface State Model.					
Value	Name	Description			Project
00h-0EFh	BTS	Index of Binding Table State Surfaces			All
F0h-0FBh	Reserved	Reserved for future use			All
0FCh	Reserved	Reserved for future use			CHV, BSW
Others	Reserved	Ignored			All

## Surface or Stateless Binding Table Index Message Descriptor Control Field

### MDC\_BTS\_A32 - Surface or Stateless Binding Table Index Message Descriptor Control Field

Project: CHV, BSW  
 Source: PRM  
 Size (in bits): 8  
 Default Value: 0x00000000

DWord	Bit	Description				
0	7:0	<b>Binding Table Index</b>				
		Project:	All			
		Format:	Enumeration			
Specifies the surface for the message, either Surface State Model or Stateless.						
Value	Name	Description	Project			
00h-0EFh	BTS	Index of Binding Table State Surfaces	All			
F0h-OFBh	Reserved	Reserved for future use	All			
OFCh	Reserved	Reserved for future use	CHV, BSW			
OFFh	A32_A64	Specifies a A32 or A64 Stateless access that is locally coherent (coherent within a thread group)	All			
0FDh	A32_A64_NC	Specifies a A32 or A64 Stateless access that is non-coherent (coherent within a thread).	All			
Others	Reserved	Ignored	All			
Restriction						
When using A32_A64_NC, SW must ensure that 2 threads do not both access the same cache line (64B)

## Thread Spawn Message Descriptor

Thread Spawn Message Descriptor																								
DWord	Bit	Description																						
0	31:20	<b>Reserved</b>																						
		Format:	MBZ																					
19	<b>Header Present</b>																							
		Format:	MBZ																					
	<b>Programming Notes</b>																							
	This bit MBZ for all Thread Spawner messages.																							
18:5	<b>Reserved</b>																							
		Format:	MBZ																					
4	<b>Resource Select</b>																							
	This field specifies the resource associated with the action taken by the Opcode.																							
	<table border="1"> <thead> <tr> <th>Value</th><th>Name</th><th>Description</th><th>Exists If</th></tr> </thead> <tbody> <tr> <td>0</td><td>Spawn Child</td><td>Spawn a Child Thread</td><td>[Opcode] == 'Spawn Thread'</td></tr> <tr> <td>1</td><td>Spawn Root</td><td>Spawn a Root Thread</td><td>[Opcode] == 'Spawn Thread'</td></tr> <tr> <td>0</td><td>Dereference Resource</td><td>The URB Handle is Dereferenced</td><td>[Opcode] == 'Dereference Resource'</td></tr> <tr> <td>1</td><td>Keep Resource</td><td>The URBHandle is NOT Dereferenced</td><td>[Opcode] == 'Dereference Resource'</td></tr> </tbody> </table>				Value	Name	Description	Exists If	0	Spawn Child	Spawn a Child Thread	[Opcode] == 'Spawn Thread'	1	Spawn Root	Spawn a Root Thread	[Opcode] == 'Spawn Thread'	0	Dereference Resource	The URB Handle is Dereferenced	[Opcode] == 'Dereference Resource'	1	Keep Resource	The URBHandle is NOT Dereferenced	[Opcode] == 'Dereference Resource'
Value	Name	Description	Exists If																					
0	Spawn Child	Spawn a Child Thread	[Opcode] == 'Spawn Thread'																					
1	Spawn Root	Spawn a Root Thread	[Opcode] == 'Spawn Thread'																					
0	Dereference Resource	The URB Handle is Dereferenced	[Opcode] == 'Dereference Resource'																					
1	Keep Resource	The URBHandle is NOT Dereferenced	[Opcode] == 'Dereference Resource'																					
3:2	<b>Reserved</b>																							
		Format:	MBZ																					
1	<b>Requester Type</b>																							
	This field indicates whether the requesting thread is a root thread or a child thread. If it is a root thread, when Opcode is 0, FF managed resources are dereferenced. If it is a child thread and Opcode is 0, no resource is dereferenced; no action is required by the TS.																							
	<table border="1"> <thead> <tr> <th>Value</th><th>Name</th></tr> </thead> <tbody> <tr> <td>0</td><td>Root Thread</td></tr> <tr> <td>1</td><td>Child Thread</td></tr> </tbody> </table>				Value	Name	0	Root Thread	1	Child Thread														
Value	Name																							
0	Root Thread																							
1	Child Thread																							
0	<b>Opcode</b>																							
	Indicates the operation performed by the message. A root thread must terminate with a message to TS (Opcode == 0 and EOT == 1). A child thread should also terminate with such a message. A thread cannot terminate with an Opcode of "spawn thread".																							

## Thread Spawn Message Descriptor

		<b>Value</b>	<b>Name</b>	<b>Description</b>
		0	Dereference Resource	also used for end of thread
		1	Spawn Thread

## Transpose Message Header

MH_T - Transpose Message Header			
DWord	Bit	Description	
0	31:0	<b>X Offset</b>	
		Project:	
		All	
		Format:	
		S31	
X offset (in bytes) of the upper left corner of the block into the surface.			
<b>Programming Notes</b>			
This field must be a multiple of the Block Width in bytes. Must be DWORD aligned.			
1	31:0	<b>Y Offset</b>	
		Project:	
		All	
		Format:	
		S31	
Y offset (in rows) of the upper left corner of the block into the surface.			
<b>Programming Notes</b>			
This field must be a multiple of the Block Height.			
2	31:0	<b>Block Dimensions</b>	
		Project:	
		All	
3-7	159:0	Format:	
		MHC_BDIM [CHV, BSW]	
		The height and width of the block to transpose.	
<b>Reserved</b>			
3-7	159:0	Project:	
		All	
3-7	159:0	Format:	
		Ignore	
Ignored			

## Untyped Write Channel Mask Message Descriptor Control Field

### MDC\_UW\_CMASK - Untyped Write Channel Mask Message Descriptor Control Field

Project: CHV, BSW

Source: PRM

Size (in bits): 4

Default Value: 0x00000000

DWord	Bit	Description	
0	3:0	<b>Mask</b>	
		Project:	All
		Format:	Enumeration
		For untyped surface write messages, indicates which channels are included in the message payload and written to the surface.	
Value	Name	Description	Project
00h	RGBA [Default]	Red, Green, Blue, and Alpha are included	All
08h	RGB	Red, Green, and Blue are included	All
0Ch	RG	Red and Green are included	All
0Eh	R	Red is included	All
Others	Reserved	Ignored	All

## Upper Oword Block Data Payload

<b>MDP_OW1U - Upper Oword Block Data Payload</b>						
<b>DWord</b>	<b>Bit</b>	<b>Description</b>				
0.0-0.3	127:0	<p><b>Reserved</b></p> <table border="1"> <tr> <td>Project:</td> <td>All</td> </tr> <tr> <td>Format:</td> <td>Ignore</td> </tr> </table> <p>Ignored</p>	Project:	All	Format:	Ignore
Project:	All					
Format:	Ignore					
0.4-0.7	127:0	<p><b>Oword</b></p> <table border="1"> <tr> <td>Project:</td> <td>All</td> </tr> <tr> <td>Format:</td> <td>U128</td> </tr> </table> <p>Specifies the upper Oword data element</p>	Project:	All	Format:	U128
Project:	All					
Format:	U128					

## VC1

VC1		
DWord	Bit	Description
0	15:8	<b>Reserved</b> Format: MBZ
	7	<b>Syncmarker Error</b> This flag indicates missing sync marker SEs coded in the bit-stream.
	6	<b>Mbmode SE Error</b> This flag indicates inconsistent Macroblock SEs coded in the bit-stream.
	5	<b>Transformtype SE Error</b> This flag indicates inconsistent transform type SEs coded in the bit-stream.
	4	<b>Coefficient Error</b> This flag indicates inconsistent Coefficient SEs coded in the bit-stream.
	3	<b>Motion Vector SE Error</b> This flag indicates inconsistent Motion Vector SEs coded in the bit-stream.
	2	<b>Coded Block Pattern CY SE Error</b> This flag indicates inconsistent CBPCY SEs coded in the bit-stream.
	1	<b>Mquant Error</b> This flag indicates inconsistent MQUANT SEs coded in the bit-stream.
	0	<b>MB Concealment Flag</b> . Each pulse from this flag indicates one MB is concealed by hardware.

## VCS Hardware-Detected Error Bit Definitions

VCS Hardware-Detected Error Bit Definitions

## VEBOX\_CSC\_STATE

VEBOX_CSC_STATE																		
DWord	Bit	Description																
0	31:29	<b>Reserved</b>																
		Format:	MBZ															
0	28:16	<b>C1</b>																
		Default Value:	0															
		Format:	S2.10 2's complement															
		Transform coefficient.																
0	15:3	<b>C0</b>																
		Default Value:	1024															
		Format:	S2.10 2's complement															
		Transform coefficient.																
0	2	<b>Reserved</b>																
		Format:	MBZ															
0	1	<b>YUV_Channel_Swap</b>																
		Default Value:	0															
		Format:	Enable															
		This bit should only be used with RGB output formats. When this bit is set, the YUV channels are swapped into the output RGB channels as shown in the following table:																
		<table border="1"> <thead> <tr> <th></th> <th colspan="2">YUV_Channel_Swap</th> </tr> <tr> <th></th> <th>0</th> <th>1</th> </tr> </thead> <tbody> <tr> <td>Y</td> <td>R</td> <td>G</td> </tr> <tr> <td>U</td> <td>G</td> <td>B</td> </tr> <tr> <td>V</td> <td>B</td> <td>R</td> </tr> </tbody> </table>		YUV_Channel_Swap			0	1	Y	R	G	U	G	B	V	B	R	
	YUV_Channel_Swap																	
	0	1																
Y	R	G																
U	G	B																
V	B	R																
		<b>Programming Notes</b>																
		In previous projects, the yuv_in and yuv_out state variables were used to offset the YUV values by ½ of their range before (for yuv_in) and after (for yuv_out) color space conversion; in addition yuv_out swapped the YUV channels. The same effect is accomplished with the per

## VEBOX TLB Control Register

VTCR - VEBOX TLB Control Register		
DWord	Bit	Description
0	31:1	<b>Reserved</b>
		Default Value: 00000000000000000000000000000000b Access: RO
0	0	<b>Invalidate TLBs on the corresponding Engine</b>
		Default Value: 0b Access: R/W
<p>SW writes 1 to invalidate the TLBs for the associated engine and HW clears the bit when invalidation is complete. To ensure proper invalidation of the TLBs, SW has to ensure the corresponding engine's HW pipeline is flushed and cleared from all its memory accesses. Otherwise HW cannot guarantee the proper invalidation for TLBs.</p> <p>This bit is self clear.</p>

[0,2048]		Bytes	CHV, BSW								
		<b>Programming Notes</b>									
		<ul style="list-style-type: none"> <li>Different VERTEX_BUFFER_STATE structures can refer to the same memory region using different Buffer Pitch values.</li> <li>See note on 64-bit float alignment in Buffer Starting Address.</li> </ul>									
1..2	63:0	<b>Buffer Starting Address</b>  Format: GraphicsAddress[63:0]Vertex_Buffer  This field contains the byte-aligned Graphics Address LSBs of the first element of interest within the VB. Software must program this value with the combination (sum) of the base address of the memory resource and the byte offset from the base address to the starting structure within the buffer. If the Address ModifyEnable bit is clear, this field is ignored and the previous value of Buffer Starting Address for this buffer is maintained.	<b>Programming Notes</b> <ul style="list-style-type: none"> <li>64-bit floating point values must be 64-bit aligned in memory, or UNPREDICTABLE data will be fetched. When accessing an element containing 64-bit floating point values, the Buffer Starting Address and Source Element Offset values must add to a 64-bit aligned address, and BufferPitch must be a multiple of 64-bits.</li> <li>VBs can only be allocated in linear (not tiled) graphics memory.</li> <li>As computed index values are, by definition, interpreted as unsigned values, there is no issue with accesses to locations before (lower address value) the start of the buffer. However, these wrapped indices are subject to Max Index checking (see below).</li> </ul>								
3	31:0	<b>Buffer Size</b>  Format: U32 Count of bytes  This field specifies the size of the buffer in bytes. Vertex element accesses which straddle or go past the end of the buffer will return 0's for all elements. Note that BufferSize=0 indicates that there is no valid data in the buffer.	<table border="1"><thead><tr><th>Value</th><th>Name</th></tr></thead></table>	Value	Name						
Value	Name										

**VERTEX\_BUFFER\_STATE**

[0, FFFFFFFFh]
----------------

## VERTEX\_ELEMENT\_STATE

VERTEX_ELEMENT_STATE		
<p>Project: All</p> <p>Source: RenderCS</p> <p>Size (in bits): 64</p> <p>Default Value: 0x00000000, 0x00000000</p>		
Description		Project
This structure is used in 3DSTATE_VERTEX_ELEMENTS to set the state associated with a vertex element. A vertex element is defined as an entity supplying from 1 to 4 DWord vertex components to be stored in the vertex URB entry. The number of supported vertex elements is:		
[CHV, BSW]: 34		CHV, BSW
The VF function will use this state, and possibly the state of the associated vertex buffer, to fetch/generate the source vertex element data, perform any required format conversions, padding with zeros, and store the resulting destination vertex element data into the vertex URB entry.		
Programming Notes		Project
<ul style="list-style-type: none"> <li>The (new) 3DSTATE_VF_SGVS command is used to specify optional insertion of VertexID and/or InstanceID into the input vertex data, logically following the processing of the VERTEX_ELEMENT_STATE structures. The VFCOMP_STORE_VID/IID encodings are no longer available in VERTEX_ELEMENT_STATE.</li> <li>When SourceElementFormat is set to one of the *64*_PASSTHRU formats, 64-bit components are stored in the URB without any conversion. In this case, vertex elements must be written as 128 or 256 bits, with VFCOMP_STORE_0 being used to pad the output as required. E.g., if R64_PASSTHRU is used to copy a 64-bit Red component into the URB, Component 1 must be specified as VFCOMP_STORE_0 (with Components 2,3 set to VFCOMP_NOSTORE) in order to output a 128-bit vertex element, or Components 1-3 must be specified as VFCOMP_STORE_0 in order to output a 256-bit vertex element. Likewise, use of R64G64B64_PASSTHRU requires Component 3 to be specified as VFCOMP_STORE_0 in order to output a 256-bit vertex element.</li> <li>When SourceElementFormat is set to one of the *64*_PASSTHRU formats then VFCOMP_STORE_SRC must be used for every valid component.</li> <li>Any SourceElementFormat of *64*_PASSTHRU cannot be used with an element which has edge flag enabled.</li> </ul>		CHV, BSW
The SourceElementFormat needs to be a single-component format with an element which has edge flag enabled.

The EdgeFlag bit will travel down the fixed function pipeline along with the vertex handle, etc. and not be stored in the vertex data like the other vertex elements. Refer to the fixed function descriptions for how this EdgeFlag affects rendering. Edge flags are supported for the following primitive topology types only, otherwise EdgeFlagEnable must not be ENABLED. <ul style="list-style-type: none"><li>• 3DPRIM_TRILIST*</li></ul>									
<b>Edge Flag Enable</b>																			
Project:	CHV, BSW																		
Format:	Enable																		
Description	Project																		
When ENABLED, the source element is interpreted as an EdgeFlag for the vertex. If the source element is zero, the EdgeFlag will be set to FALSE. If the source element is non-zero, the EdgeFlag will be set to TRUE. The EdgeFlag bit will travel down the fixed function pipeline along with the vertex handle, etc. and not be stored in the vertex data like the other vertex elements. Refer to the fixed function descriptions for how this EdgeFlag affects rendering. Edge flags are supported for the following primitive topology types only, otherwise EdgeFlagEnable must not be ENABLED. <ul style="list-style-type: none"><li>• 3DPRIM_TRILIST*</li></ul>

## VFE\_STATE\_EX

VFE_STATE_EX		
DWord	Bit	Description
0	31:8	<b>Reserved</b>
	7:0	<b>Reserved</b> Format: MBZ
1	31:0	<b>VFE Control</b> This field is used by VFE depending on the mode of operation. See the following tables for details. If VFE Mode = AVC-IT or AVC-MC, this field is valid as defined in Table 1 13. If VFE Mode = VC1-IT, this field is valid as defined in Table 1 14. Otherwise, this field is reserved.
2	31:0	<b>Interface Descriptor Remap Table</b> This field contains the interface descriptor remap table entries for the first 8 kernel indices. Each table entry has 4 bits, providing a remapping range of [0, 15]. The input of this table is the Interface Descriptor Offset within the MEDIA_OBJECT or MEDIA_OBJECT_EX command. As the table is limited to map the first 16 values, any Interface Descriptor Offset greater than 15 is not remapped. Bits 31:28: Remap for index = 7 Bits 27:24: Remap for index = 6 Bits 23:20: Remap for index = 5 Bits 19:16: Remap for index = 4 Bits 15:12: Remap for index = 3 Bits 11:8: Remap for index = 2 Bits 7:4: Remap for index = 1 Bits 3:0: Remap for index = 0
3	31:0	<b>Interface Descriptor Remap Table (cont)</b> This field contains the interface descriptor remap table entries for the next 8 kernel indices (index = 8...15). Each table entry has 4 bits, providing a remapping range of [0, 15]. Bits 31:28: Remap for index = 15 Bits 27:24: Remap for index = 14 Bits 23:20: Remap for index = 13 Bits 19:16: Remap for index = 12 Bits 15:12: Remap for index = 11 Bits 11:8: Remap for index = 10 Bits 7:4: Remap for index = 9 Bits 3:0: Remap for index = 8
4	31	<b>Scoreboard Enable</b>
		Project: CHV, BSW
		This field enables and disables the hardware scoreboard in the Media Pipeline. If this field is cleared, hardware ignores the following scoreboard state fields.
		This should be enabled at all times in the state and the scoreboard enable field in the MEDIA_OBJECT command should be used instead. If this field is disabled, the scratch space pointer calculation will be incorrect and any attempt to use the scoreboard later will result in a hardware hang.
Value		Name
0	Scoreboard disabled	

<b>VFE_STATE_EX</b>												
		1	Scoreboard enabled									
30	<b>Scoreboard Type</b>											
	Project: CHV, BSW											
	This field selects the type of scoreboard in use.											
	This field must be zero (stalling scoreboard)											
	<table border="1"> <thead> <tr> <th>Value</th><th>Name</th><th></th></tr> </thead> <tbody> <tr> <td>0</td><td>Stalling Scoreboard</td><td></td></tr> <tr> <td>1</td><td>Reserved (for Non-stalling scoreboard)</td><td></td></tr> </tbody> </table>			Value	Name		0	Stalling Scoreboard		1	Reserved (for Non-stalling scoreboard)	
Value	Name
